¹Wilfrid Laurier University, Department of Chemistry, Ontario, Canada, ²University of Waterloo, Faculty of Engineering, Waterloo, Canada

With 2014 marking the International Year of Crystallography (IYRc) one can't help but look back in awe with respect to how far the science has come. At the same time, we are always looking forward to new techniques, technologies and transformational methods that push our science even further. So what is the state of the union, what are the major areas for growth, and what will crystallography look like in 5, 10, 25 and 100 years? In seeking to answer these questions, we are providing conference attendees an opportunity to peer into their crystal balls and answer these questions.

Keywords: International, Crystallography, Anniversary
