Molecules of (*R*)-2,3,4,5-tetrahydro-2,2,4-trimethyl-1,5-benzothiazepine, $C_{12}H_{17}NS$, are linked into spiral *C*(5) chains by a single N—H···S hydrogen bond, while molecules of *rac*-5-benzoyl-2,3,4,5-tetrahydro-2,2,4-trimethyl-1,5-benzothiazepine, $C_{19}H_{21}NOS$, are linked into zigzag chains by a C—H···π(arene) hydrogen bond.

Comment

We report here the molecular and supramolecular structures of two trimethylbenzothiazepines, (I) and (II), and we compare them with the *N*-nitroso analogue, (III), whose structure has been reported recently (Laavanya *et al.*, 2002). These compounds are of interest because their molecular constitutions have some resemblance to that of the calcium antagonist drug diltiazem [(2*S*,3*S*)-3-acetoxy-5-(dimethylaminoethyl)-2-(4-methoxyphenyl)-2,3-dihydro-1,5-benzothiazepin-4(*H*)-one, (IV)] and its 2*R*,3*R* enantiomer (Kojić-Prodić *et al.*, 1984).

Compounds (I) and (II) (Figs. 1 and 2) both contain a stereogenic centre at atom C4, so giving rise to the possibility of *R* and *S* enantiomers. In (I), which crystallizes in the chiral space group *P*2₁, the crystal examined contained the *R* enantiomer only. By contrast, (II) crystallizes as a racemic mixture in space group *Pna*2₁; the reference molecule in (II) was selected as having the *R* configuration. Compound (III) also crystallizes as a racemate, in space group *C*2/c (Laavanya

et al., 2002), with the reference molecule again selected as the *R* enantiomer.

In the thiazepine rings of each of (I)–(III), the C11–C10–S1–C2 and C10–C11–N5–C4 torsion angles (Table 1) have similar magnitudes with opposite signs, as do the S1–C2–C3–C4 and N5–C4–C3–C2 angles, indicative of approximate pseudo-mirror symmetry for these portions of the ring, making due allowance for the differing atom types and bond distances. However, the magnitudes of the final pair of torsion angles, C10–S1–C2–C3 and C1–N5–C4–C3, differ markedly, although they still have opposite signs. Accordingly, it is not possible to describe any of these ring conformations in terms of a single primitive form (Evans & Boeyens, 1989). In (I), the thiazepine conformation is a mixture of boat, chair and twist-chair forms; in (II), the boat form is dominant, with a small contribution from the twist-chair form; and in (III), the conformation is best described as intermediate between boat and twist-boat. The bond lengths and angles in (I) and (II) show no unusual features.

The only direction-specific interaction between the molecules of (I) (Fig. 1) is an N—H···S hydrogen bond (Table 1). Although the N···S distance is greater than the sum (3.3 Å) of the conventional van der Waals radii (Bondi, 1964), an analysis (Allen *et al.*, 1997) of hydrogen bonds having two-

coordinate sulfur as the acceptor, using data retrieved from the Cambridge Structural Database (Allen, 2002), indicated mean H···S, N···S and N—H···S parameters in such bonds, where S is bonded to two C atoms, of 2.74 (2) Å, 3.58 (3) Å and 145 (3)°, respectively. Accordingly, the N—H···S interaction in (I) appears to be typical of such hydrogen bonds. The status of N—H···S hydrogen bonds remains uncertain. While Desiraju & Steiner (1999) regard sulfur as a conventional

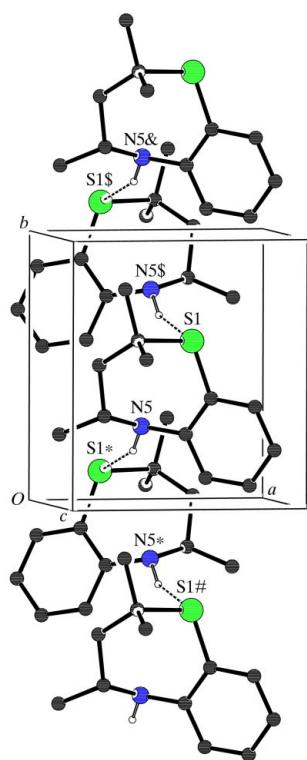

Figure 3

Part of the crystal structure of (I), showing the formation of a *C*(5) chain along [010]. For clarity, H atoms bonded to C atoms have been omitted. Atoms marked with an asterisk (*), a hash (#), a dollar sign (\$) or an ampersand (&) are at the symmetry positions $(1 - x, -\frac{1}{2} + y, z)$, $(x, -1 + y, z)$, $(1 - x, \frac{1}{2} + y, z)$ and $(x, 1 + y, z)$, respectively.

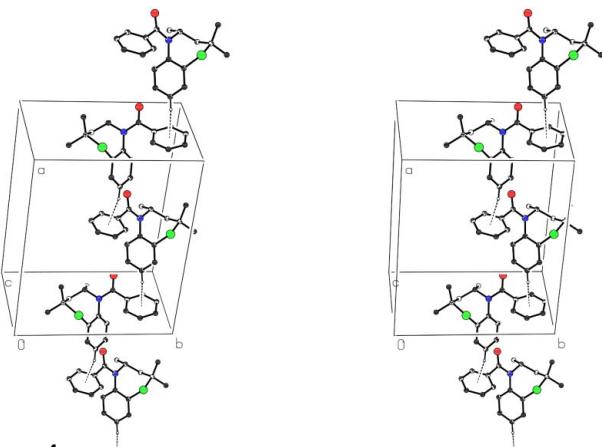

Figure 4

hydrogen-bond acceptor, Allen *et al.* (1997) concluded that two-coordinate sulfur is a poor hydrogen-bond acceptor and that only in dialkyl sulfides lacking any other potential acceptors are X —H···S hydrogen bonds ($X = N$ or O) likely to be significant contributors to molecular aggregation. Against that view, we note that in triphenylmethanesulfenamide, Ph_3SNH_2 , the molecules are linked into centrosymmetric $R_2^2(6)$ dimers by paired N—H···S hydrogen bonds (Glidewell & Ferguson, 1994). The action of the N—H···S hydrogen bond in (I), where atom N5 in the molecule at (x, y, z) acts as a donor to atom S1 in the molecule at $(1 - x, -\frac{1}{2} + y, z)$, is to link the molecules into a spiral *C*(5) (Bernstein *et al.*, 1995) chain running parallel to the [010] direction and generated by the 2_1 screw axis along $(\frac{1}{2}, y, 0)$ (Fig. 3).

In (II), the molecules are linked by a single C—H··· π (arene) hydrogen bond (Table 2). Atom C8 in the molecule at (x, y, z) acts as a hydrogen-bond donor to the C51—C56 acyl ring in the molecule at $(-\frac{1}{2} + x, \frac{3}{2} - y, z)$, so forming a zigzag [100] chain generated by the *a*-glide plane at $y = \frac{3}{4}$ (Fig. 4). Two chains of this type pass through each unit cell, but there are no direction-specific interactions between adjacent chains.

In contrast to the N—H···S and C—H··· π (arene) hydrogen bonds in (I) and (II), respectively, the structure of (III) (Laavanya *et al.*, 2002) contains no hydrogen bonds or direction-specific interactions of any kind between the molecules.

Experimental

Compound (I) was synthesized by reducing 2,3-dihydro-2,2,4-trimethyl-1,5-benzodiazepine with sodium borohydride in methanol at 273 K (Hsing *et al.*, 1966). Compound (II) was prepared by benzoylation of (I) with benzoyl chloride and triethylamine in dry benzene under reflux conditions. Analysis for (II) found: C 73.3, H 6.9, N 4.3%; $\text{C}_{19}\text{H}_{21}\text{NOS}$ requires: C 73.3, H 6.8, N 4.5%. Crystals of (I) and (II) suitable for single-crystal X-ray diffraction were grown from solutions in light petroleum [m.p. 358–361 K for (I) and 383–386 K for (II)].

Data collection

Nonius KappaCCD
diffractometer
Radiation source: rotating anode
Graphite monochromator
 φ scans, and ω scans with κ offsets
Absorption correction: multi-scan
(SORTAV; Blessing, 1995, 1997)
 $T_{\min} = 0.866$, $T_{\max} = 0.983$

19245 measured reflections
3762 independent reflections
3605 reflections with $I > 2\sigma(I)$
 $R_{\text{int}} = 0.064$
 $\theta_{\max} = 27.5^\circ$, $\theta_{\min} = 3.0^\circ$
 $h = -20 \rightarrow 19$
 $k = -16 \rightarrow 16$
 $l = -10 \rightarrow 10$

Refinement

Refinement on F^2
Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.045$
 $wR(F^2) = 0.130$
 $S = 1.26$
3762 reflections
203 parameters
1 restraint
Primary atom site location: structure-invariant
direct methods
Secondary atom site location: difference Fourier
map

Hydrogen site location: inferred from
neighbouring sites
H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + (0.0742P)^2 + 0.2569P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} = 0.001$
 $\Delta\rho_{\max} = 0.63 \text{ e \AA}^{-3}$
 $\Delta\rho_{\min} = -0.84 \text{ e \AA}^{-3}$
Extinction correction: SHELXL97,
 $Fc^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Extinction coefficient: 0.145 (9)
Absolute structure: Flack (1983), 1719 Friedel
pairs
Absolute structure parameter: 0.01 (9)
