Key indicators

Single-crystal X-ray study
T = 190 K
Mean $\sigma(\text{C}-\text{C}) = 0.002 \text{ \AA}$
R factor = 0.027
wR factor = 0.064
Data-to-parameter ratio = 21.0

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

(2*R*,5*S*)-2-Trichloromethyl-3-oxa-1-azabicyclo-[3.3.0]octane-4,8-dione

The crystal structure of the title bicyclic oxazolidindione, $\text{C}_7\text{H}_6\text{Cl}_3\text{NO}_3$, confirmed the absolute stereochemistry as 2*R*,5*S*.

Comment

Natural α -amino acids are at the core of many natural products (Ikota, 1992). (*S*)-pyroglutamic acid, in particular, forms the core of many excitatory amino acids, such as kaitocephalin (Watanabe *et al.*, 2002) and kainic acid (Oppolzer & Thirring, 1982). Synthetic routes to these classes of compounds require stereochemical control at various positions around a pyrrolidine ring. Seebach's method of the so-called self-reproduction of chirality involves a dual protection of the amine and carboxylic acid of (*S*)-proline with pivaldehyde to give a bicyclic system (Seebach *et al.*, 1983). The analogous protection of (*S*)-pyroglutamic acid was found to be unfavourable for pivaldehyde, the resulting product being particularly unstable (Dikshit *et al.*, 1995). However, analogous protection of (*S*)-pyroglutamic acid with chloral (Amedjkouh & Ahlberg, 2002) provided the title compound, (3) (shown in Fig. 1 and Table 1), as an air-stable crystalline solid.

Experimental

The title compound was prepared by the method described by Amedjkouh & Ahlberg (2002). Slow recrystallization from ethyl acetate gave colourless needle-like crystals. These tend to fracture when cut and therefore a large crystal was used. The multi-scan technique was used to correct for changes in the illuminated volume.

Crystal data

$\text{C}_7\text{H}_6\text{Cl}_3\text{NO}_3$
 $M_r = 258.49$
Orthorhombic, $P2_12_12_1$
 $a = 6.0480 (1) \text{ \AA}$

Figure 2

Packing diagram of (3), viewed down the a axis.

The H atoms were all seen in a difference map but those attached to C atoms were repositioned geometrically. The H atoms were initially refined with soft restraints on the bonds to regularize their geometry [bond lengths to accepted values, angles either set by symmetry or to accepted values, and $U_{\text{iso}}(\text{H})$ dependent on the adjacent bonded atom], after which they were refined with riding constraints only. C—H = 0.93–0.98 \AA and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Data collection: *COLLECT* (Nonius, 1997–2001); cell refinement: *DENZO/SCALEPACK* (Otwinowski & Minor, 1997); data reduction: *DENZO/SCALEPACK*; program(s) used to solve structure: *SIR92* (Altomare *et al.*, 1994); program(s) used to refine structure: *CRYSTALS* (Betteridge *et al.*, 2003); molecular graphics: *CAMERON* (Watkin *et al.*, 1996); software used to prepare material for publication: *CRYSTALS*.

RP thanks the EPSRC for a grant and GlaxoSmithKline for a CASE award.
