Received 23 January 2008; accepted 14 February 2008

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.011$ Å; R factor = 0.048; wR factor = 0.108; data-to-parameter ratio = 15.5.

In the title compound, $[\text{Ir}(\text{C}_{10}\text{H}_8\text{N}_3)(\text{C}_{11}\text{H}_8\text{N})_2]$, the Ir center is octahedrally coordinated by the three chelating ligands, with two cyclometalated 2-pyridylphenyl ligands [$\text{Ir}-\text{N} = 2.049$ (5) and 2.030 (5) Å; $\text{Ir}-\text{C} = 2.016$ (6) and 2.012 (6) Å] and a bidentate 2-(phenyldiazenyl)pyrrolate ligand [$\text{Ir}-\text{N} = 2.204$ (5) and 2.079 (5) Å]. The $\text{Ir}-\text{N}(\text{diazenyl})$ bond is longer than the $\text{Ir}-\text{N}(\text{pyrrolate})$ bond. The structure is stabilized by aromatic $\pi-\pi$ stacking, the shortest parallel distance between ring centroids being 3.426 (8) Å.

[2-(Phenyldiazenyl)pyrrolato]bis(2-pyridylphenyl)iridium(III)

Wen-Ying Li, Li-Sheng Mao, Long Lu and Hong-Wu He

S1. Comment

Transition-metal (Ir) complexes that display intense phosphorescence from metal-to-ligand charge transfer (MLCT) excited states have been widely investigated (Baldo *et al.*, 2000; Pomestcheako *et al.*, 2003; Chen *et al.*, 2003). These Ir complexes with long excited-stated lifetimes and high luminescent efficiencies can be used in a variety of photonic applications such as photocatalysis and organic light-emitting diodes (Chin *et al.*, 1995). We report here the molecular structure of (I), (Fig. 1).

In the title compound (I), all the bond lengths and angles fall within normal ranges. Moreover, the Ir—C bond lengths are found to be shorter than the Ir—N bond lengths. In comparison with bis(2-pyridylphenyl)(acetylacetonate) iridium (Ir(ppy)₂(acac)) which was reported in the literature (Lamansky *et al.*, 2001), this title complex displays longer Ir—N bond with the same *cis*-C, *C trans*-N, N chelate disposition. The dihedral angles between rings in the two ppy ligands are 5.2 (4)° [between rings N4/C11–C15 and C16–C21] and 5.5 (6)° [(between rings N5/C28–C32 and C22–C27)].

S2. Experimental

To a stirring solution of 2-(2-phenylazo)-1*H*-pyrrole (60 mg, 0.35 mmol) in dichloromethane (15 ml), sodium acetate (23 mg, 0.28 mmol) and [IrCl(ppy)₂]₂ (150 mg, 0.14 mmol) were added. The mixture was allowed to stir under an argon atmosphere at room temperature for 12 h. Then, the mixture was diluted with water and extracted thrice with 10 ml of dichloromethane. The organic extracts were combined and dried over anhydrous magnesium sulfate. After the solvent was removed *in vacuo*, the resulting residue was subjected to flash chromatography on silica gel using dichloromethane to afford the title compound (yield 75%). Red crystals of (I) suitable for X-ray structure analysis were grown from the mixture of dichloromethane and petroleum ether (*v/v*, 1:6).

S3. Refinement

All H-atoms were positioned geometrically and refined using a riding model with $d(\text{C—H}) = 0.93 \text{ \AA}$ and $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$.

 $(\Delta/\sigma)_{\max} = 0.002$
 $\Delta\rho_{\max} = 4.15 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -2.38 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
