Received 10 April 2008; accepted 12 May 2008

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.004 Å; R factor = 0.040; wR factor = 0.120; data-to-parameter ratio = 19.7.

In the title compound, $C_{37}H_{33}BrN_4O_6$, the pyrrolidine ring adopts an envelope conformation. The β-lactam ring is planar and makes dihedral angles of 70.16 (13) and 28.32 (13)° with the phenyl and 4-methoxyphenyl rings, respectively. The molecular packing is stabilized by intramolecular C—H···O interactions and the crystal packing is determined by intermolecular N—H···O hydrogen bonds, and C—H···O and C—H···π interactions.

S1. Comment

β–Lactams with a substituent at the N atom, which is easily removable under mild conditions have found wide applicability in the synthesis of bicyclic *β*–lactam antibiotics (Lukacs & Ohno, 1990). Substituted pyrrolidines have gained much importance because they are the structural elements of many alkaloids. It has been found that they exhibit antifungal activity against various pathogens (Amal Raj *et al.*, 2003). Optically active pyrrolidine derivatives have been used as intermediates in controlled asymmetric synthesis (Suzuki *et al.*, 1994). Since the title compound, (**I**), also contains an indole unit it may also exhibit some biological activity. In view of these, the structure of title compound is determined to establish the conformation of the molecule (Fig. 1).

The bond lengths and angles in **I** are agree with those observed in a similar structure (Sundari Bhaskaran *et al.*, 2006; Kamala *et al.*, 2008). The *β*–lactam ring is planar with its internal angles in the range 84.4 (2) to 95.5 (2)°. The C–C–C bond angle in the *β*–lactam ring is comparable to the values in related reported structures (Ulku *et al.*, 1997). The bond N4?C16, is shorter than the bond lengths, N4—C14 and N4—C17 and is close to the length of a double bond, a feature observed in *β*–propiolactam (Yang *et al.*, 1987) and where C and N are sp^2 hybridized.

The methoxy group is coplanar with the C17/C18/C19/C20/C21/C22 benzene ring: dihedral angle C21–C20–O6–C23 = 161.0 (4)°. The methoxyphenyl and the phenyl rings bridged by the *β*–lactam ring are oriented at an angle of 42.32 (11)° with respect to each other, whereas the *β*–lactam ring makes a dihedral angles of 28.32 (13)° and 70.16 (13)° with them respectively. The indole moiety is planar and makes a dihedral angle of 38.01 (11)°, 62.8 (7)° and 73.8 (9)° with the *β*–lactam, bromophenyl and phenyl rings respectively. The nitro–group is orthogonal to indole moiety [89.2 (2)°] and makes a dihedral angle of 66.6 (3)° with the *β*–lactam ring.

The pyrrolidine ring N2/C10/C11/C12/C13 adopts an envelope conformation, with asymmetry parameters (Nardelli, 1995), ΔC_S(C13) = 0.038 (2) and puckering parameters (Cremer & Pople, 1975) q_2 = 0.377 (2)Å and φ = 150.8 (3)°. Atom C13 deviates from the mean plane defined by N2/C10/C11/C12 on 0.573 (8) Å.

In the crystal structure of **I** (Fig.2), adjacent molecules are linked by N—H···O and C—H···O hydrogen bonds into chains. In addition, the packing is stabilized by C—H···*Cg* interactions involving C3/C4/C5/C6/C7/C8 rings with centroid *Cg*.

S2. Experimental

The *β*–lactam aldehyde (1 mol) was treated with tryptophanmethylester hydrochloride (1 mol) in the presence of Et_3N (2.5 mol) and anhydrous $MgSO_4$ (2 g) in dry dichloromethane (10 ml) at room temperature for 12 h to give the imine. The imine was washed with water and dried over Na_2SO_4. The solvent was evaporated under vacuum. The imine (1 mol) was then strirred with silver(I) acetate and *p*–bromo nitrostyrene (1 mol) in the presence of Et_3N (1.2 mol) and molecular sieves in dry toluene (30 ml) at room temperature for 12 h. The reaction mixture was filtered through a plug celite. The

solvent was evaporated under reduced pressure and the residue was subjected to column chromatography on silica gel (100–200 mesh), with hexane–ethyl acetate (7:3) as eluent to give the product. The compound was recrystallized from ethyl acetate.

S3. Refinement

H atoms were placed in idealized positions and allowed to ride on their parent atoms, with C—H = 0.93, 0.98, 0.97 and 0.96 Å for aromatic, methine, methylene and methyl H respectively, and N—H = 0.86 Å, and with U_{iso}(H) = 1.5i>U_{eq}(C) for methyl and U_{iso}(H) = 1.2i>U_{eq}(parent C, N) for all other H atoms.

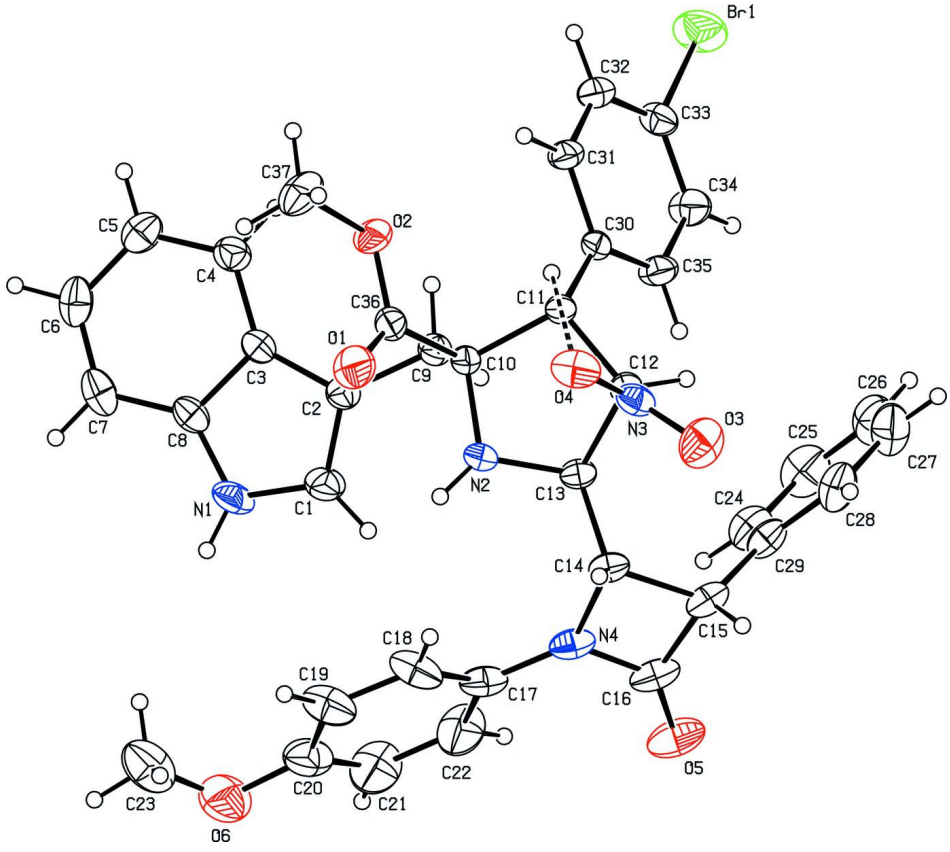

Figure 1

The molecular structure of **I**. The displacement ellipsoids are drawn at 30% probability level. H atoms are presented as a small spheres of arbitrary radius. The intramolecular H–bond are drawn by dashed line.

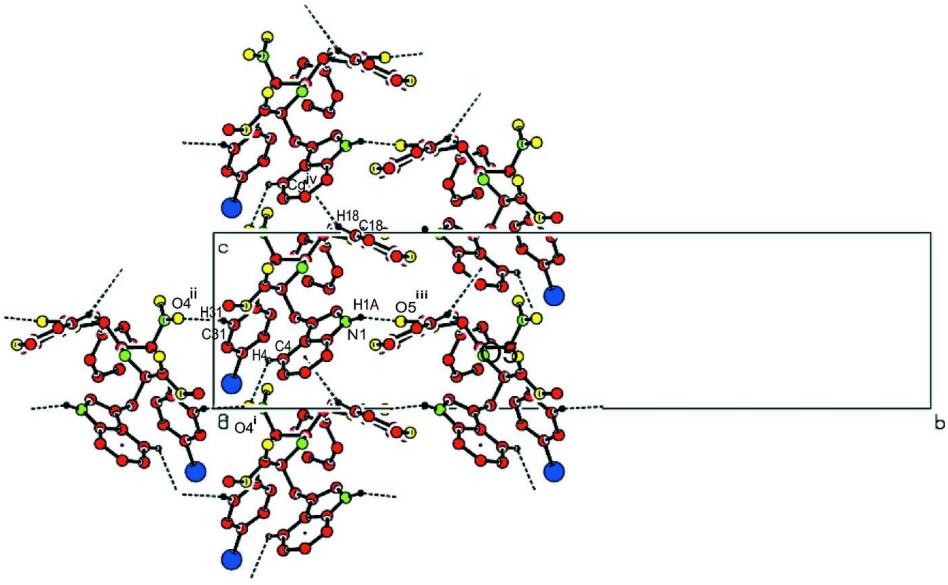

Figure 2

The packing of the molecules viewed down the *a* axis. Dashed lines indicate hydrogen bonds. H atoms not involed in hydrogen bonds have been ommited for clarity. Symmetry codes: (i) *x*, *y*, *z* - 1; (ii) *x*, -*y* + 2, *z* - 1/2; (iii) *x* + 1/2, -*y* + 3/2, *z* - 1/2; (iv) *x*, *y*, *z* + 1.

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*–factor *wR* and goodness of fit *S* are based on F^2, conventional *R*–factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*–factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*–factors based on F^2 are statistically about twice as large as those based on *F*, and *R*–factors based on ALL data will be even larger.
