Received 3 June 2008; accepted 28 July 2008

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(\text{C}-\text{C}) = 0.010$ Å; R factor = 0.047; wR factor = 0.070; data-to-parameter ratio = 14.3.

The asymmetric unit of the title compound, $\{[\text{Cu}_2\text{Fe}(\text{CN})_6(\text{C}_2\text{H}_8\text{N}_2)_4] \cdot 4.5\text{H}_2\text{O}\}_n$, consists of two $[\text{Cu}(\text{C}_2\text{H}_8\text{N}_2)_2]^{2+}$ cations, one $[\text{Fe}(\text{CN})_6]^{4-}$ anion, four water molecules and a half water molecule that lies on a twofold rotation axis. The Fe^{II} atom is coordinated by six C atoms from three terminal and three doubly bridging CN^- ligands. The bridging CN^- ligands connect the anion to a five-coordinate $[\text{Cu}(\text{C}_2\text{H}_8\text{N}_2)_2]^{2+}$ cation and to two symmetry-related six-coordinate $[\text{Cu}(\text{C}_2\text{H}_8\text{N}_2)_2]^{2+}$ cations, forming a one-dimensional polymer in the ab plane. Intermolecular hydrogen bonds connect the polymer units into a three-dimensional network.

S1. Comment

Hexacyanoferrate anions $[\text{Fe}(\text{CN})_6]^{n-}$ act as good building blocks to provide bimetallic assemblies exhibiting planar structures (Fu *et al.* 2005). In this paper we report the structure of the title compound, (I), which forms linear polymer chains.

The asymmetric unit of the title compound, $[\text{Cu}_2(\text{C}_2\text{H}_8\text{N}_2)_4\text{Fe}(\text{CN})_6 \cdot 4.5\text{H}_2\text{O}]_n$, consists of two $[\text{Cu}(\text{C}_2\text{H}_8\text{N}_2)]^{2+}$ cations, one $[\text{Fe}(\text{CN})_6]^{4-}$ anion, four water molecules and a half water molecule that lies on a two-fold rotation axis (Fig. 1). The Fe1 atom is coordinated by six nitrile C atoms from three terminal CN⁻ ligands and three doubly bridging CN⁻ ligands. Cu1 is coordinated by five N atoms from two chelating ethylenediamine (en) ligands and a doubly bridging CN⁻ ligand while Cu2 binds to six N atoms from two chelated en ligands and two doubly bridging CN⁻ ligands (Fig. 2). The average Fe—C distance of the bridging CN⁻ ligands of 1.909 (6) Å (Table 1) is slightly shorter than that of the terminal CN⁻ ligands, 1.937 Å. The average Cu—N bond distance involving the en ligands is 2.009 Å considerably shorter than the average Cu—N(nitrile) distance of 2.472 Å. These are similar to the corresponding N—Cu bonds in the compound $[\text{Cu}_2(\text{C}_4\text{N}_2\text{S}_2)_2(\text{C}_2\text{H}_8\text{N}_2)_2]_n$ (Fu, *et al.*, 2004). The coordination geometries about the Fe1 and Cu2 centers are distorted octahedral with Cu1 displaying a distorted square-pyramidal geometry. The bridging CN⁻ ligands connect the anion to the five coordinate Cu1 cation and to the Cu2 and Cu2ⁱ (I = x+1/2, y-1/2, z) cations to form a one dimensional polymer. In the crystal structure, the water O atoms and N atoms from the en and CN⁻ ligands participate in intermolecular hydrogen bonds (Table 2), which further connect the polymer chains into a three-dimensional network (Fig. 3).

S2. Experimental

A solution (10 ml) of distilled water containing $\text{CuSO}_4 \cdot 6\text{H}_2\text{O}$ (1.0 mmol) was added slowly to aqueous mixture (20 ml) of $\text{K}_4[\text{Fe}(\text{CN})_6]$ (0.5 mmol) and NH_3 (2 mmol). The mixture was stirred for 4 h and then filtered. Crystals suitable for X-ray analysis were obtained by slow evaporation of a methanol/dichloromethane (1:2 v/v) solution over a period of three weeks. Elemental analysis found: C, 25.37%; H, 6.22%; N, 29.58%; calc. for $\text{C}_{28} \text{H}_{82} \text{Cu}_4 \text{Fe}_2 \text{N}_{28} \text{O}_9$: C, 25.45%; H, 6.26%; N, 29.69%.

S3. Refinement

Water H atoms were found in difference maps and were refined freely with isotropic displacement parameters. All other H atoms were placed in idealized positions and constrained to ride on their parent atoms, with C—H = 0.97 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$, N—H = 0.90 Å, and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$.
