Key indicators: single-crystal X-ray study;  $T = 295$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002$  Å;  $R$  factor = 0.041;  $wR$  factor = 0.106; data-to-parameter ratio = 14.9.

The stabilized conformation of the title compound,  $\text{C}_{36}\text{H}_{25}\text{NO}_3$ , 4-(9-anthryl)-1-(2-methoxyphenyl)-spiro[azetidin-3,9'-xanthen]-2-one, may be compared with that of the isomeric compound 4-(9-anthryl)-1-(4-methoxyphenyl)spiro[azetidin-3,9'-xanthen]-2-one. In the title isomer, the methoxy group is slightly twisted out of the plane of the attached benzene ring, with a  $\text{C}-\text{O}-\text{C}$  torsion angle of  $31.5$  ( $2$ )°. Its  $\beta$ -lactam ring is essentially planar, with a maximum deviation of  $-0.021$  ( $1$ ) Å. The  $\beta$ -lactam ring makes dihedral angles of  $18.815$  ( $9$ ),  $83.33$  ( $7$ ) and  $53.62$  ( $8$ )° with the mean planes of the benzene, xanthen and anthracene ring systems, respectively. The structure is stabilized by  $\text{C}-\text{H}\cdots\pi$ ,  $\text{C}-\text{H}\cdots\text{N}$  and  $\text{C}-\text{H}\cdots\text{O}$  interactions.

### S1. Comment

The importance of  $\beta$ -lactams for the treatment of bacterial infections has been amply established (Georg & Ravikumar, 1993; Palomo *et al.*, 2001). Large efforts have been made for the synthesis and structural modification of the  $\beta$ -lactam nucleus to increase antimicrobial activity. New and interesting spiro- $\beta$ -lactam-containing structures have been recently reported due to their structural features and their bioactivity (Jarrahpour & Khalili, 2007; Pınar *et al.*, 2006; Akkurt, Jarrahpour *et al.*, 2008; Akkurt, Karaca *et al.*, 2008). Banik and coworkers have synthesized polycyclic aroaromatic  $\beta$ -lactams with potential anticancer properties (Banik *et al.*, 2004). The title compound (I) is isomeric with 4-(9-anthryl)-1-(4-methoxyphenyl)spiro[azetidin-3,9'-xanthen]-2-one (II), whose crystal structure has been previously reported by Akkurt, Karaca *et al.* (2008). Both isomers crystallize in the monoclinic space group  $P2_1/c$ . The volume of the unit cell of the title isomer (I) is smaller than that of (II).

As can be seen in Fig. 1, the  $\beta$ -lactam ring of (I) is nearly planar, with a maximum deviation of  $-0.021$  (1) Å from the ring. The planarity is mainly due to the  $sp^2$  hybridization of atoms C29 and N1. The dihedral angle between the benzene ring C30—C35 attached at N1 and the  $\beta$ -lactam ring is  $58.80$  (6)°, in the isomeric compound (II), the equivalent angle is  $28.45$  (14)° (Akkurt, Karaca *et al.*, 2008) due to steric interactions resulting in different orientations of the methoxy group. The methoxy group is slightly twisted out of the plane of the attached benzene ring [C36—O3—C35—C34 =  $31.5$  (2)°, and in (II)  $-4.6$  (4)].

In the xanthen ring system, attached at C16, the benzene rings (C17—C22) and (C23—C28) form a dihedral angle of  $16.78$  (8)° with each other. The central ring, C16/C17/C22/O1/C23/C28, is not planar, with puckering parameters:  $Q_T = 0.2173$  (14) Å,  $\theta = 95.6$  (4)° and  $\varphi = 358.3$  (4)° (Cremer & Pople, 1975). The mean plane of the xanthen ring system forms dihedral angles of  $83.33$  (7)°, and  $65.92$  (6)°, with the  $\beta$ -lactam ring and the benzene ring C30—C35, respectively.

The anthracene ring system, attached at C15, is almost planar, with maximum deviations of  $-0.074$  (2) Å for C2,  $0.046$  (2) Å for C4,  $0.040$  (2) Å for C5 and  $-0.055$  (1) Å for C8. It forms dihedral angles of  $53.62$  (8)°,  $58.80$  (6)° and  $69.89$  (4)°, with the  $\beta$ -lactam ring, benzene ring (C30—C35) and the mean plane of the xanthen ring system, respectively.

The molecular structure of the title compound is stabilized by two intramolecular C—H $\cdots$ O and C—H $\cdots$ N hydrogen bonding interactions (Table 1). Fig. 2 shows the packing diagram viewed down the  $a$  axis. Two C—H $\cdots$  $\pi$  interactions are also found between C5—H5 and the centroid of the C30—C35 benzene ring, and C26—H26 and the centroid of the C8—C13 benzene ring.

*Special details*

**Geometry.** Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement on  $F^2$  for ALL reflections except those flagged by the user for potential systematic errors. Weighted  $R$ -factors  $wR$  and all goodnesses of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The observed criterion of  $F^2 > \sigma(F^2)$  is used only for calculating  $-R$ -factor-obs *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
