Received 13 March 2009; accepted 19 March 2009

Key indicators: single-crystal X-ray study;  $T = 200$  K; mean  $\sigma(C-C) = 0.009$  Å;  $R$  factor = 0.056;  $wR$  factor = 0.122; data-to-parameter ratio = 13.4.

The reaction of  $[Ru(C_9H_{10}BN_6)Cl(C_{18}H_{15}P)_2]$  with benzonitrile leads to crystals of the title compound,  $[Ru(C_9H_{10}BN_6)Cl(C_{18}H_{15}P)(C_7H_5N)] \cdot C_2H_5OH$ . In the crystal structure, the environment about the ruthenium metal center corresponds to a slightly distorted octahedron with an average N–Ru–N bite angle of 86.6 (2)°.

### S1. Comment

Hydridotris(pyrazoly)borate anion ( $Tp,HB(pz)_3$ ) has been introduced by Trofimenko as a ligand in the preparation of various transition metal complexes (Trofimenko, 1993). Ruthenium(II) hydridotripyrazolylborate complexes, Ru( $Tp$ ), are of interest for stoichiometric and catalytic transformations of organic molecules (Pavlik *et al.*, 2005). The complex  $[Ru(Tp)Cl(PPh_3)_2]$  (Alcock *et al.*, 1992) has been used as the starting material for the synthesis of several complexes because of its substitutionally labile chloride and phosphine substituents (Burrows, 2001). On the other hand, Benzonitrile can form coordination complex with late transition metals that are both soluble in organic solvents and conveniently labile, *e.g.*  $PdCl_2(\text{PhCN})_2$ . The benzonitrile ligands are readily displaced by stronger ligands, making benzonitrile complexes useful as synthetic intermediates.

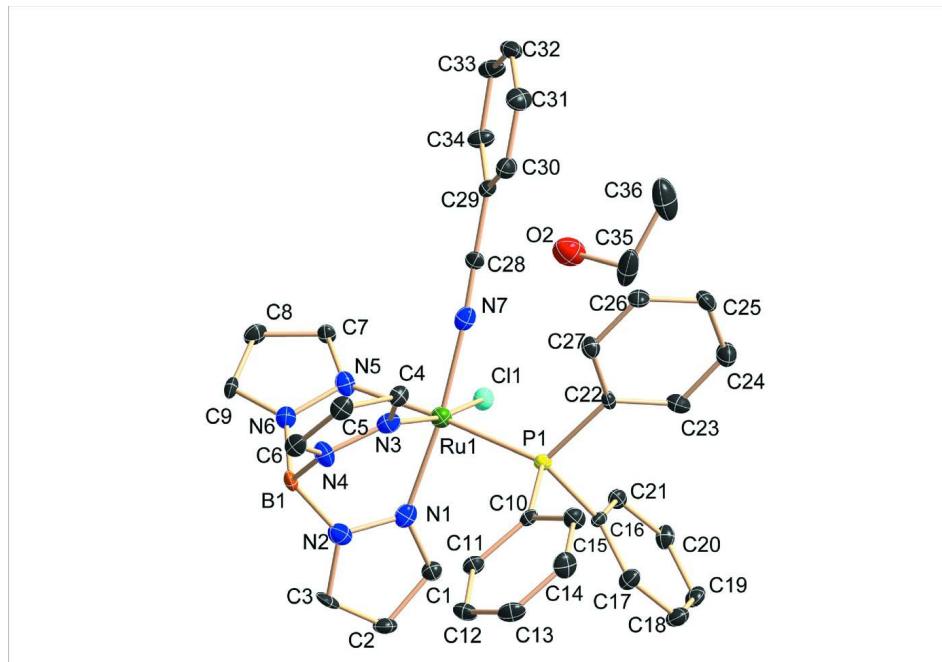

In the crystal structure of the title compound the ruthenium metal center is coordinated by four N, one P and one Cl atom within slightly distorted octahedra. The average N—Ru—N bite angle to the  $Tp$  ligand amount to  $86.6(2)^\circ$ . The three Ru—N( $Tp$ ) bond lengths of  $2.063(5)$ ,  $2.069(4)$  and  $2.102(5)$  Å are slightly longer than the average distance of  $2.038$  Å in other ruthenium  $Tp$  complexes (Gemel *et al.* 1996; Slugovc *et al.* 1998). The Ru1—N7 and N7—C28 bond lengths of  $1.991(5)$  Å and  $1.144(7)$  Å correspond to single Ru—N and C≡N bonds. The crystal structure contains additional ethanol molecules, which are connected to the chloro atom via weak O—H···Cl hydrogen bonding.

### S2. Experimental

To a solution of  $[Ru(Tp)Cl(PPh_3)_2]$  (3.95 g, 4.50 mmol) in toluene (100 ml), an excess of benzonitrile (4.6 ml, 45.0 mmol) was added. The mixture was heated using a warm water bath for 30 min. A deep yellow color developed during this time. The reaction mixture was stirred for a further 2 h at room temperature (298 K). Then it was concentrated to approximately half of the volume and cooled to 273 K. The yellow precipitate was filtered off, washed with ethanol and ether and dried under vacuum to give the title compound (I) (2.09 g, 65% yield). The bright-yellow crystals of (I) for X-ray structure analysis were obtained by recrystallization of the crude product from dichloromethane–ethanol containing free benzonitrile. The IR spectra display one medium band near  $2214\text{ cm}^{-1}$ , which was assigned to the  $\nu(\text{CN})$  vibration of the nitrile ligand. We have observed that the benzonitrile is lost readily in solution. Therefore, in all operations for the purification of the title compound, an excess of free nitrile was added in order to prevent the nitrile ligand dissociation.

### S3. Refinement

The H atoms were placed in idealized positions and constrained to ride on their parent atoms, with C—H =  $0.95 - 0.99$  Å and  $U_{\text{iso}}(\text{H}) = 1.2$  or  $1.5U_{\text{eq}}(\text{C})$ , B—H =  $1.0$  Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{B})$ , and O—H =  $0.84$  Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$ .

**Figure 1**

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
