Received 28 August 2009; accepted 6 September 2009

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(\text{C}-\text{C}) = 0.012$  Å;  $R$  factor = 0.059;  $wR$  factor = 0.160; data-to-parameter ratio = 16.6.

The title compound,  $\text{C}_{10}\text{H}_{16}\text{Br}_2\text{N}_4$ , was synthesized by the reaction of 1-methylimidazole and 1,2-dibromoethane in toluene. The complete dication is generated by a crystallographic inversion centre situated at the mid-point of the ethane C—C bond. In the crystal structure, weak intermolecular C—H...Br interactions link the molecules into chains along the  $b$  axis and an intramolecular C—H...Br close contact is also present.

**3,3'-Dimethyl-1,1'-ethylenediimidazolium dibromide**

Yu Chen, Wei Song, Juan Xu, Rui-bo Cui and Dan-bi Tian

**S1. Comment**

The title compound is a kind of ionic liquids to be used as green alternatives to volatile organic solvents in electrochemical, synthetic and separation processes. For general background, see: (Ding *et al.*, 2007). We herein report the crystal structure of the title compound (I).

In the molecule of (I), (Fig. 1), the bond lengths (Allen *et al.*, 1987) and angles are within normal ranges. The whole molecule has an inversion symmetry located on the ethane group of the main molecule.

In the crystal structure, weak intermolecular C—H $\cdots$ Br interactions (Table 1) link the molecules into chains along the *b* axis (Fig.2), in which they may be effective in the stabilization of the structure.

**S2. Experimental**

The ionic liquid compound was prepared following modified literature procedures (Ding *et al.*, 2007). 1-Methylimidazole (8.21 g, 0.1 mol) was mixed with 1,2-dibromoethane (9.38 g, 0.05 mol) in 100 ml of toluene and refluxed for 24 h; the mixture was cooled to room temperature and filtered. The solids were washed several times with ethyl acetate (800 ml) and the white product dried in vacuum (yield: 7.3 g, 54.2%). The product was dissolved in the chloroform and the crystals were obtained by evaporating the chloroform slowly at room temperature for about 9 d.

**S3. Refinement**

Carbon-bound H atoms were positioned with idealized geometry [aromatic C—H = 0.93 Å, methylene C—H = 0.97 Å and methyl C—H = 0.96 Å] and refined with fixed isotropic displacement parameters [ $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{H})$  (methyl C) and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$  (aromatic and methylene C)] using a riding model.

**Figure 1**

A drawing of the title molecular structure, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. Atoms labeled with the suffixes A are generated by the symmetry operation  $(-x+1, -y+1, -z+1)$ . Hydrogen bonds are shown by dashed lines.

Figure 2

A packing diagram for (I).

neighbouring sites

H-atom parameters constrained

$w = 1/[\sigma^2(F_o^2) + (0.1P)^2 + 0.7P]$

where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} < 0.001$

$\Delta\rho_{\max} = 0.80$  e Å<sup>-3</sup>

$\Delta\rho_{\min} = -0.85$  e Å<sup>-3</sup>

#### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
