Received 1 September 2009; accepted 3 September 2009

Key indicators: single-crystal X-ray study; *T* = 296 K; mean  $\sigma(\text{C}-\text{C})$  = 0.002 Å; *R* factor = 0.032; *wR* factor = 0.089; data-to-parameter ratio = 14.9.

The title compound, C<sub>16</sub>H<sub>18</sub>N<sub>2</sub>S<sub>2</sub>, lies about an inversion center with only half of the molecule in the asymmetric unit. The cyclohexane ring adopts a chair conformation, and the terminal thiophene rings are in a *transoid* orientation, with an S...S separation between the two terminal 2-thiophene rings of 11.6733 (9) Å.

***N*<sup>1</sup>,*N*<sup>4</sup>-Bis(2-thienylmethylene)cyclohexane-1,4-diamine****Kyung-Eun Lee and Soon W. Lee****S1. Comment**

Design and construction of coordination polymers (or metal–organic frameworks, MOFs) are currently under intensive study due to their desirable applications in catalysis, nonlinear optical activity, spin crossover, luminescence, long-range magnetism, adsorption–desorption, and gas storage (Batten *et al.*, 2009; Perry IV *et al.*, 2009; Robin & Fromm, 2006). In preparing such polymers, appropriate linking ligands play a fundamental role. We have continually reported long bis-(pyridine)-, bis(furan)-, bis(thiophene)-, and (pyridine–amine)-type linking ligands and their coordination polymers (Yun *et al.* 2009). As an extension to our ongoing study of novel linking ligands and their coordination polymers, we have prepared a long, potential linking ligand containing an intervening cyclohexane ring with two terminal thiophene rings.

The molecular structure of the title compound (Fig. 1) contains an intervening cyclohexane ring between two iminethiophene ( $\text{—N=CH—2-thiophene}$ ) fragments. The cyclohexane ring fragment adopts a chair conformation. The imine fragments occupy the equatorial sites of the cyclohexane ring and are *trans* with respect to each other. The terminal thiophene rings also adopt an overall *transoid* conformation. The S...S separation between the two terminal 2-thiophene rings is 11.6733 (9) Å. Several related linking ligands containing terminal thiophene rings were previously employed to obtain coordination networks: (2-thiophene)—CH=N—N=CH—(2-thiophene) (Lee & Lee, 2007; Huh *et al.*, 2008) and (3-thiophene)—CH=N—N=CH—(3-thiophene) (Kim & Lee, 2008).

**S2. Experimental**

At room temperature, *trans*-1,4-diaminocyclohexane (1.0 g, 8.76 mmol) was added to 2-thiophene carboxaldehyde (1.72 ml, 18.72 mmol) in 80 ml methanol. After adding dichloromethane (50 ml) and three drops of formic acid, the mixture was stirred for 15 h, and then the solvent was removed under vacuum. The resulting solid was extracted with dichloromethane (150 ml) and washed with water (30 ml  $\times$  3). The organic phase was dried over MgSO<sub>4</sub> and then filtered. All the solvent was removed to give white crude solid, which was recrystallized from dichloromethane/hexane to give colorless crystals of the title compound suitable for X-ray crystallographic study (2.05 g, 6.78 mmol, 77%). mp: 511–513 K.

**S3. Refinement**

All H atoms were located from difference maps and refined isotropically.

 $l = -22 \rightarrow 19$

#### Refinement

Refinement on  $F^2$   
 Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.032$   
 $wR(F^2) = 0.089$   
 $S = 1.02$   
 1889 reflections  
 127 parameters  
 0 restraints  
 Primary atom site location: structure-invariant  
 direct methods

Secondary atom site location: difference Fourier  
 map  
 Hydrogen site location: inferred from  
 neighbouring sites  
 All H-atom parameters refined  
 $w = 1/[\sigma^2(F_o^2) + (0.0484P)^2 + 0.1406P]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} = 0.001$   
 $\Delta\rho_{\max} = 0.19 \text{ e \AA}^{-3}$   
 $\Delta\rho_{\min} = -0.18 \text{ e \AA}^{-3}$

*Special details*

**Experimental.** IR (KBr,  $\text{cm}^{-1}$ ): 3443 (w), 3103 (w), 2923 (m), 2852 (w), 1626 (s), 1430 (m), 1306 (w), 1210 (m), 1084 (m), 944 (m), 847 (m), 730 (s), 498 (m).

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
