Received 10 November 2009; accepted 19 November 2009

Key indicators: single-crystal X-ray study;  $T = 295$  K; mean  $\sigma(\text{C}-\text{C}) = 0.006$  Å;  $R$  factor = 0.042;  $wR$  factor = 0.119; data-to-parameter ratio = 8.2.

In the crystal of the title compound,  $\text{C}_{15}\text{H}_{10}\text{N}_2\text{O}_3$ , the molecules are linked together by intermolecular  $\text{N}-\text{H}\cdots\text{N}$  hydrogen bonds into chains along the  $c$  axis. The crystal structure also shows weak intermolecular  $\text{C}-\text{H}\cdots\pi$  hydrogen bonds. The three furanyl rings bonded to the imidazole core are not coplanar with the latter; the dihedral angles between the furanyl and imidazole ring planes are 29.3 (2), 19.4 (2), and 4.8 (2)°.

## 2,4,5-Tri-2-furyl-1*H*-imidazole

Shuai-Jun Wang, Qiang Gu, Qing Su, Xiao-Dong Chen and Yu-Min Zhang

### S1. Comment

As an important member of the five-membered heterocycles, the imidazole moiety is present in a wide range of naturally occurring molecules (Ho *et al.*, 2003). Compounds with an imidazole ring system have many pharmacological properties and play important roles in biochemical processes. (Lambardino & Wiseman, 1974). The biological importance of the imidazole ring system has made it a common substructure in numerous synthetic compounds such as fungicides, herbicides, plant growth regulators and therapeutic agents. Recent advances in green chemistry and organometallic chemistry have extended the boundary of imidazoles to the synthesis and application of a large class of imidazoles as ionic liquids (Bao *et al.*, 2003) and imidazole-related N-heterocyclic carbenes (Füstner *et al.*, 2000). Compounds containing the furan ring easily react with singlet oxygen (Sundberg *et al.*, 1996). As most devices are operated under an oxygen-free environment, in recent years furan derivatives have been used in research of photoelectric materials.

In the crystal structure of the title molecule (Fig.1), the three furan rings and the imidazole ring are not coplanar. The dihedral angles between the three furan rings C1/C2/C3/C4/O1, C7/C8/C9/C10/O2, C12/C13/C14/C15/O3 and the imidazole ring N1/C5/C6/N2/C11 are 29.3, 19.4 and 4.8°, respectively. The neighbouring molecules are nearly vertical to each other with the dihedral angle 98.0° and linked together by intermolecular N—H···N hydrogen bonds into 1-D infinite chains along the *c* axis (Table 1, Fig.2). The crystal structure also shows weak intermolecular C—H··· $\pi$  hydrogen bonds (Fig. 3), Cg = centroid of N1/C5/C6/N2/C11.

### S2. Experimental

A mixture of furil (5.26 mmol, 1 g) and ammonium acetate (52.6 mmol, 4.05 g) in acetic acid (20 ml) was refluxed. After completion of the reaction confirmed by TLC, the reaction mixture was cooled to room temperature, poured into 100 ml of water, and then neutralized with a 20% NaOH aqueous solution to pH 9. The mixture was extracted with ethyl acetate, and the solvent was removed by rotary evaporation. The crude product was further purified by column chromatography using a mixture of petroleum ether and ethyl acetate (3:1) as eluents. Then 2,4,5-tri(furan-2-yl)-1*H*-imidazole was recrystallized from methanol. Yellow single crystals were obtained by slow evaporation of the solvent at ambient temperature. For C<sub>15</sub>H<sub>10</sub>N<sub>2</sub>O<sub>3</sub>, MS: 267.2 (*M*+H)<sup>+</sup>, found:266.2.

### S3. Refinement

The C-bound H atoms were positioned geometrically with C—H = 0.93 Å, and allowed to ride on their parent atoms in the riding model approximation with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ . The H atom attached to N was found in a difference Fourier map and refined isotropically. Friedel opposites were merged.

**Figure 1**

The molecule of the title compound, showing the atom labelling scheme. Displacement ellipsoids are drawn at the 30% probability level and H atoms are shown as small spheres of arbitrary radii.

**Figure 2**

Packing of the molecules showing the intermolecular N—H...N interactions to form a 1-D chain. Color scheme: blue, nitrogen; red, oxygen; grey, carbon; green, hydrogen.

**Figure 3**

Packing of the molecules showing the C—H... $\pi$  interactions.  $C_g$  is the centroid of the imidazole ring (N1/C5/C6/N2/C11).  $C10\cdots C_g = 3.6031(31)$  Å. The green spots are the centers of the aromatic rings.

**Figure 4**

The formation of the title compound.

 $\Delta\rho_{\min} = -0.14 \text{ e \AA}^{-3}$

*Special details*

**Experimental.** (See detailed section in the paper)

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
