Received 26 February 2010; accepted 27 February 2010

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.043; wR factor = 0.110; data-to-parameter ratio = 16.0.

The Co^{II} atom (site symmetry $\bar{1}$) in the title complex, $[\text{Co}(\text{C}_7\text{H}_3\text{N}_2\text{O}_6)_2(\text{CH}_3\text{OH})_4]$, exists within an octahedral O_6 donor set defined by two O -monodentate 3,5-dinitrobenzoate anions and four methanol O atoms. An intramolecular $\text{O}_m-\text{H}\cdots\text{O}_c$ (m = methanol and c = carbonyl) hydrogen bond leads to the formation of an $S(6)$ ring. In the crystal, centrosymmetrically related molecules associate via further $\text{O}_m-\text{H}\cdots\text{O}_c$ hydrogen bonds, leading to linear supramolecular chains propagating along the a -axis direction.

Bis(3,5-dinitrobenzoato- κO^1)tetramethanolcobalt(II)

Bipasa Sarkar, Abhijit Roy, Seik Weng Ng and Edward R. T. Tiekkink

S1. Comment

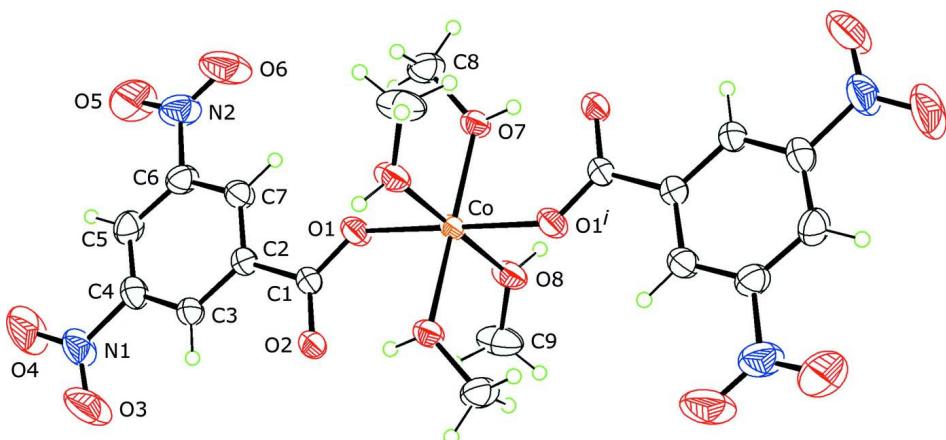

The Co(II) atom in (I), Fig. 1, is located on a crystallographic centre of inversion and exists within an octahedral O_6 donor set defined by two carboxylate-O1 atoms and four methanol-O atoms. The Co—O1 bond distance [Co—O1 = 2.0666 (17) Å] is comparable to those, *i.e.* 2.0525 (20) and 2.0587 (19) Å, found in the related tetra-aqua-bis(3,5-dinitrobenzoato-*O*)cobalt(II) tetrahydrate structure (Tahir *et al.*, 1996; Yang *et al.*, 2000; Jin *et al.*, 2008). A small disparity in the Co—O_{methanol} bond distances in (I) [Co—O7 = 2.1094 (16) and Co—O8 = 2.0645 (18) Å] is noted. The methanol-O7—H hydrogen forms an intramolecular O—H···O hydrogen bond with the carbonyl-O2 atom to close an almost planar {Co—O—C—O···H—O} S(6) ring, Table 1. The methanol-O8—H also forms a hydrogen bond to the carbonyl-O2 atom on a centrosymmetrically related complex, Table 1. This results in the formation of 12-membered {Co—O—H···O—C—O}₂ synthons and linear supramolecular chains along the *a* axis, Fig. 2. It is noted that the packing of molecules brings into close proximity two nitro-O atoms, *i.e.* O4···O4ⁱⁱ = 2.756 (3) Å for 3-*x*, -*y*, 2-*z*. While the nature of this interaction is not obvious, there are approximately 50 precedents for such O_{nitro}···O_{nitro} contacts < 2.70 Å in the crystallographic literature (Allen, 2002).

S2. Experimental

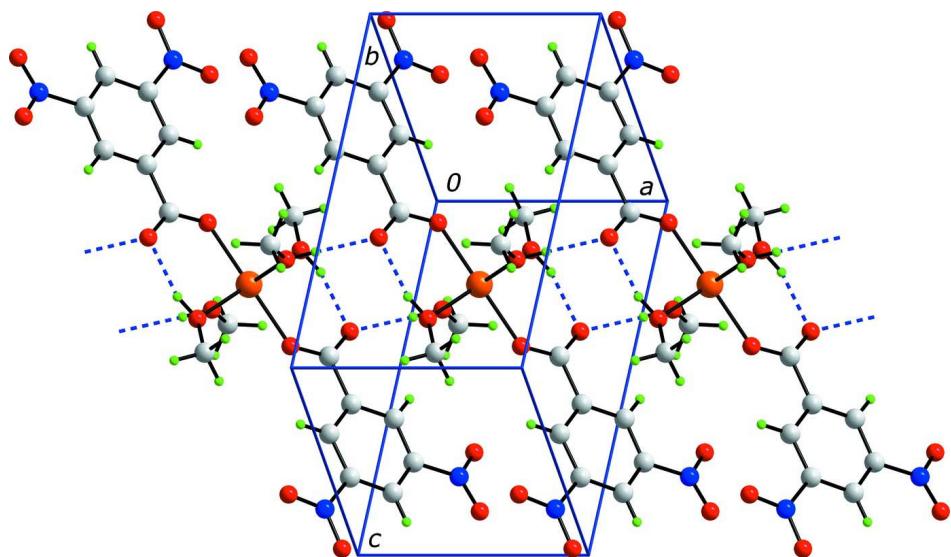

All chemicals purchased from commercial sources (AR/GR grade) were used without further purification. The crystalline sodium salt of 3,5-dinitrobenzoic acid was prepared by neutralising 3,5-dinitrobenzoic acid (1.00 g, 4.70 mmol) by NaOH (1.88 g, 4.70 mmol) in water. On concentration the solution yielded the sodium salt (1). To a purple solution of CoCl₂·6H₂O (0.50 g, 2.10 mmol) in water (15 ml) was added, with stirring, a solution of (1) (0.98 g, 4.20 mmol) in a mixture of water (3 ml) and methanol (140 ml) when the colour of the mixture turned pink. The solution was then heated under reflux for 6 h. Pink prisms of (I) were obtained from the filtrate after 25 days on slow evaporation.

S3. Refinement

Carbon-bound H-atoms were placed in calculated positions (C—H 0.93 to 0.96 Å) and were included in the refinement in the riding model approximation, with $U_{\text{iso}}(\text{H})$ set to 1.2 to 1.5 $U_{\text{equiv}}(\text{C})$. The methanol H-atoms were located in a difference Fourier map, and were refined with a distance restraint of O—H 0.85±0.01 Å; their U_{iso} values were freely refined

**Figure 1**

The molecular structure of (I) extended to show the coordination geometry for the Co(II) atom, showing displacement ellipsoids at the 50% probability level. Symmetry operation i : $1-x, 1-y, 1-z$.

**Figure 2**

Linear supramolecular chain along the a axis in (I) mediated by $O—H\cdots O$ hydrogen bonding. These and the intramolecular $O—H\cdots O$ hydrogen bonds are shown as blue dashed lines.

and constrained refinement $w = 1/[\sigma^2(F_o^2) + (0.0522P)^2 + 0.1427P]$
where $P = (F_o^2 + 2F_c^2)/3$ $(\Delta/\sigma)_{\max} = 0.001$ $\Delta\rho_{\max} = 0.38\text{ e \AA}^{-3}$ $\Delta\rho_{\min} = -0.30\text{ e \AA}^{-3}$ *Special details*

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
