Key indicators: single-crystal X-ray study;  $T = 120$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  $R$  factor = 0.065;  $wR$  factor = 0.189; data-to-parameter ratio = 17.0.

The asymmetric unit of the title compound,  $\text{C}_{21}\text{H}_{18}\text{ClN}_3\text{O}$ , contains two crystallographically independent molecules which differ slightly in the orientations of chlorobenzoyloxy units. In one of the molecules, the phenyl and chlorophenyl rings are oriented at dihedral angles of  $38.09$  (6) and  $42.15$  (6)°, respectively, with respect to the benzotriazole ring [43.23 (6) and  $29.80$  (6)° in the other molecule]. The dihedral angle between the phenyl and chlorophenyl rings is  $77.63$  (6)° in one of the molecules and  $72.97$  (6)° in the other. The crystal structure is stabilized by weak  $\text{C}-\text{H}\cdots\pi$  interactions.

**1-[2-(4-Chlorobenzoyloxy)-2-phenylethyl]-1*H*-benzotriazole****Özden Özel Güven, Meral Bayraktar, Simon J. Coles and Tuncer Hökelek****S1. Comment**

In recent years, there has been increasing interest in the syntheses of heterocyclic compounds that have biological and commercial importance. Clotrimazole, miconazole, econazole, ketonazole, itraconazole and fluconazole are well-known imidazoles. 1*H*-1,2,4-Triazole ring containing azole derivatives have been developed for clinical uses as antifungal agents. Recently, structures containing benzimidazole ring in place of miconazole and econazole have been reported, and these molecules have been shown more antibacterial activity than antifungal activity (Özel Güven *et al.*, 2007a,b). The crystal structures of miconazole (Peeters *et al.*, 1979a), ketonazole (Peeters *et al.*, 1979b), econazole (Freer *et al.*, 1986), itraconazole (Peeters *et al.*, 1996) and fluconazole (Caira *et al.*, 2004) have been reported. Recently, we reported crystal structures of related compounds (Özel Güven *et al.*, 2008a,b,c). Benzotriazole derivatives also exhibit a good degree of analgesic, antiinflammatory, diuretic, antiviral and antihypertensive activities (Hirokawa *et al.*, 1998; Yu *et al.*, 2003; Kopanska *et al.*, 2004). Crystal structures of benzotriazole ring possessing compounds have been reported (Katritzky *et al.*, 2001; Swamy *et al.*, 2006; Özel Güven *et al.*, 2010). Now, we report herein the crystal structure of the title benzotriazole derivative.

The asymmetric unit of the title compound (Fig. 1) contains two crystallographically independent molecules which differ slightly in the orientations of the chlorobenzoyloxy units. The bond lengths and angles are generally within normal ranges. In each molecule, the planar benzotriazole rings [A (N1-N3/C1-C6) and A' (N1'-N3'/C1'-C6')] are oriented with respect to the phenyl [B (C9-C14) and B' (C9'-C14')] and benzene [C (C16-C21)] and C' (C16'-C21')] rings at dihedral angles of A/B = 37.98 (9), A/C = 42.27 (9) ° and A'/B' = 43.20 (9), A'/C' = 29.82 (9)°. The dihedral angles between phenyl and benzene rings are B/C = 77.63 (6) and B'/C' = 72.97 (6) °. Atoms C7 and C7' are -0.012 (2) and -0.112 (2) Å away from the planes of the benzotriazole rings, respectively.

In the crystal structure, molecules are stacked along the *a*-axis (Fig. 2). Weak C—H... $\pi$  interactions (Table 1) involving the C9-C14, C9'-C14' and C16-C21 rings stabilize the structure.

**S2. Experimental**

The title compound was synthesized by the reaction of 2-(1*H*-benzotriazol-1-yl)-1-phenylethanol (Özel Güven *et al.*, 2010) with aryl halide using NaH. 2-(1*H*-Benzotriazol-1-yl)-1-phenylethanol (200 mg, 0.84 mmol) was dissolved in DMF (4 ml). NaH (33 mg, 0.84 mmol) was added to the solution portionwise. After stirring the mixture a few minutes, 4-chlorobenzyl bromide (171.8 mg, 0.84 mmol) was added dropwise. Then, the reaction mixture was stirred additional 3 h at room temperature. The reaction was stopped by adding methanol (5 ml). After evaporation of the solvent, dichloromethane was added to the reaction mixture and extracted with water. Then, the organic phase was separated, dried, filtered and evaporated. The precipitate formed was purified by column chromatography using chloroform and crystallized from *iso*-propanol to obtain colorless crystals suitable for X-ray analysis (yield; 137 mg, 46%).

## S3. Refinement

H atoms were positioned geometrically with C-H = 0.95, 1.00 and 0.99 Å for aromatic, methine and methylene H, respectively, and constrained to ride on their parent atoms, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

#### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional R-factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and R-factors based on ALL data will be even larger.

### Hydrogen-bond geometry ( $\text{\AA}$ , $^\circ$ )

Cg1, Cg2 and Cg3 are centroids of the C9—C14, C9'—C14' and C16—C21 rings, respectively.
