Received 27 April 2010; accepted 7 May 2010

Key indicators: single-crystal X-ray study; $T = 173\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.021; wR factor = 0.047; data-to-parameter ratio = 28.1.

The title compound, $\{(C_8H_{20}N_2)[PbBr_4]\}_n$, crystallizes as an inorganic–organic hybrid with alternating layers of diammonium cations and two-dimensional corner-sharing PbBr_6 octahedra extending parallel to the bc plane, which are eclipsed relative to one another. Both PbBr_6 octahedra and the organic cation exhibit $\bar{1}$ symmetry. The cations interact via $\text{N}-\text{H}\cdots\text{Br}$ hydrogen bonding in the right-angled halogen sub-type of the terminal halide hydrogen-bonding motif.

Related literature

For hydrogen-bonding nomenclature for inorganic–organic hybrids, see: Mitzi (1999). Hybrid structures containing diammonium cations have been synthesized by Dobrzycki & Woźniak (2008) and Zhu *et al.* (2003). The semiconducting properties of similar hybrids were demonstrated by Mitzi (2004). For the related chloridoplumbate(II), see: Rayner & Billing (2010a) and for the isotopic iodidoplumbate(II), see: Rayner & Billing (2010b).

Poly[1,4-bis(ammoniomethyl)cyclohexane [di- μ -bromido-dibromidoplumbate(II)]]

Matthew Kyle Rayner and David Gordon Billing

S1. Comment

Inorganic-organic hybrid materials are of interest due to their electronic and fluorescent properties (Mitzi, 2004). The title structure (Fig. 1) is one of three 2-dimensional hybrid structures that we have synthesized incorporating this di-ammonium cation. The structures differ in terms of their halogen ligands, which include bromide (presented here), chloride (Rayner & Billing, 2010a) and iodide (Rayner & Billing, 2010b). The bromide and iodide hybrids crystallize in the monoclinic crystal system in space group $P2_1/c$ while the chloride compound crystallizes in the orthorhombic $Pnma$ system.

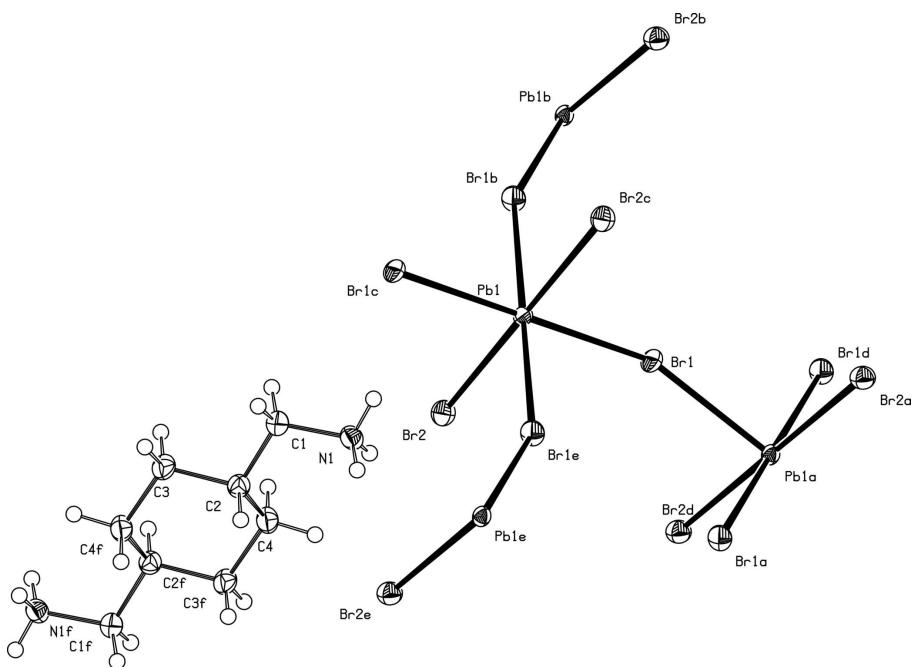

In the title structure the lead atoms in the $PbBr_6$ octahedra occupy inversion centers, giving the octahedra $\bar{1}$ symmetry. The $PbBr_6$ octahedra share corners to form layers extending parallel to the bc plane. Octahedra from alternate layers are eclipsed relative to one another (Fig. 2). In all three structures only the *trans* form of the cation has been observed giving the cation $\bar{1}$ symmetry (Fig. 3). Very few inorganic-organic hybrid structures incorporating diammonium cations have been reported (Dobrzycki & Woźniak, 2008; Zhu *et al.*, 2003). The ammonium cations interact with the inorganic layer via N—H \cdots X ($X = Br, I$ and Cl) hydrogen bonding in the right-angled halogen subtype of the terminal halide hydrogen bonding motif (Mitzi, 1999).

S2. Experimental

A mixture of 0.050 g (0.14 mmol) $PbBr_2$ and 0.021 g (0.15 mmol) 1,4-bis-(aminomethyl)-cyclohexane (mixture of isomers) was dissolved in 5 ml HBr at 383 K and slowly cooled at a rate of 0.069 K/min to yield colourless, plate-shaped single crystals suitable for X-ray analysis.

S3. Refinement

The H atoms on the diammonium cation were refined using a riding-model, with C—H = 0.99 Å, N—H = 0.91 Å and with $U_{iso}(H)=1.2U_{eq}(C)$ or $1.5U_{eq}(N)$. The highest residual electron density peak (0.78 e Å $^{-3}$) was 0.923 Å from Pb1.

**Figure 1**

Special details

Experimental. Numerical intergration absorption corrections based on indexed crystal faces were applied using the *XPREP* routine (Bruker, 2005)

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger.
