Received 30 June 2010; accepted 1 July 2010

Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002$  Å;  $R$  factor = 0.022;  $wR$  factor = 0.057; data-to-parameter ratio = 25.8.

The asymmetric unit of the title compound,  $(\text{C}_{11}\text{H}_{18}\text{N}_2)_2[\text{CdCl}_6] \cdot 2\text{H}_2\text{O}$ , consists of one 1-benzylpiperazine-1,4-dium cation, one water molecule and one-half of a  $[\text{CdCl}_6]^{4-}$  anion, located on an inversion centre. The crystal packing is governed by an extensive three-dimensional network of intermolecular  $\text{O}-\text{H} \cdots \text{Cl}$ ,  $\text{C}-\text{H} \cdots \text{Cl}$ ,  $\text{N}-\text{H} \cdots \text{O}$  and  $\text{N}-\text{H} \cdots \text{Cl}$  hydrogen bonds, two of them bifurcated.

**Bis(1-benzylpiperazine-1,4-dium) hexachloridocadmate(II) dihydrate**

**Meher El Glaoui, Matthias Zeller, Erwann Jeanneau and Cherif Ben Nasr**

**S1. Comment**

As a part of our ongoing investigations in molecular salts containing *meta*-chlorido complexes (El Glaoui, Jeanneau, *et al.*, 2009; El Glaoui, Kefi *et al.*, 2009), we present here the crystal structure of one such compound,  $(C_{11}H_{18}N_2)_2CdCl_6 \cdot 2H_2O$ , (Fig. 1). The asymmetric unit of its structure consists of one 1-benzylpiperazine-1,4-dium dication doubly protonated at the N1 and N2 nitrogen atoms, one water molecule and one-half of a  $CdCl_6^{4-}$  anion (located on a crystallographic inversion centre) (Fig. 1). The atomic arrangement of  $(C_{11}H_{18}N_2)_2CdCl_6 \cdot 2H_2O$  can be described as built up by inorganic chains of  $CdCl_6$  octahedra and water molecules extending along the *b* direction held together by  $O-H \cdots Cl$  hydrogen bonds (Fig. 2, Table 1). Two such chains cross the unit cell at  $z = 0$ ,  $z = 1/2$  and  $x = 1/2$  (Fig. 3). The organic groups are located between these chains and connect to them through  $N-H \cdots Cl$ ,  $C-H \cdots Cl$  and  $N-H \cdots O$  hydrogen bonds to form a three dimensional infinite network (Fig. 3, Table 1). All the chloride ions are involved in hydrogen bonding. It should be pointed out at this point that the  $C-H \cdots Cl$  hydrogen bonds do usually not play a large role in stabilizing a structure (Janiak & Scharmann, 2003), but due to the large number of these interactions in the title compound they seem to substantially contribute to the choice of packing observed in the structure of the title compound. Among all the hydrogen bonds, two are bifurcated:  $N2-H2A \cdots (Cl1, Cl2)$  and  $N2-H2B \cdots (Cl2, Cl3)$ . The H1 hydrogen atom attached to the N1 nitrogen atom is bonded only to the water molecule, *via* the  $N1-H1 \cdots O1$  hydrogen bond, and not to the  $CdCl_6^{4-}$  anion.

The Cd II ion is in an octahedral coordination environment composed of six chloride anions as to form an hexachlorocadmate (II) ion. In this kind of anion, the Cd—Cl bond lengths and Cl—Cd—Cl bond angles are generally not equal to one another but vary with the environment around the Cl atoms (Bala *et al.*, 2006). In the title compound, the values of the Cd—Cl bond lengths vary between 2.5528 (5) and 2.7055 (4) Å. The Cl—Cd—Cl angles range from 87.354 (11) to 92.646 (11)°. These geometrical parameters agree with those found in  $[Co(NH_3)_6]_4 [CdCl_6] [CdCl_4(SCN)(H_2O)]_2 Cl_2 \cdot 2H_2O$  where the Cd—Cl distances are between 2.5937 (9) and 2.691 (1) Å and the Cl—Cd—Cl angles ranging from 89.23 (3) to 95.50 (3)° (Bala *et al.*, 2006). Owing to the obvious differences of Cd—Cl distances and Cl—Cd—Cl angles in  $(C_{11}H_{18}N_2)_2CdCl_6 \cdot 2H_2O$ , the coordination geometry of the Cd atom could be regarded as a slightly distorted octahedron which is in full agreement with the literature data (Bala, *et al.*, 2006).

**S2. Experimental**

1-Benzylpiperazine (2 mmol, 0.352 g) and  $CdCl_2$  (1 mmol, 0.183 g), were dissolved in dilute HCl (10 ml, 1 M) and the resultant solution was slowly evaporated at room temperature. A crystal of the title compound, which remained stable under normal conditions of temperature and humidity, was isolated after several days and subjected to X-ray diffraction analysis (yield 55%).

### S3. Refinement

C—H and NH<sub>2</sub><sup>+</sup> hydrogen atoms were placed in calculated positions with C—H in the range 0.93–0.97 and N—H equal to 0.92 Å. The N—H<sup>+</sup> and the water hydrogen atom positions were refined with N—H and O—H distance restraints of 0.91 (2) and 0.84 (2) Å. The  $U_{\text{iso}}(\text{H})$  values of all H atoms were constrained to 1.2 or 1.5 times  $U_{\text{eq}}$  of the respective parent atom.

**Figure 1**

 $\Delta\rho_{\min} = -0.83 \text{ e } \text{Å}^{-3}$

Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
