

2-Amino-5-chloropyridinium 3-carboxy-4-hydroxybenzenesulfonate

Madhukar Hemamalini and Hoong-Kun Fun*‡

X-ray Crystallography Unit, School of Physics, Universiti Sains Malaysia, 11800 USM, Penang, Malaysia

Correspondence e-mail: hkfun@usm.my

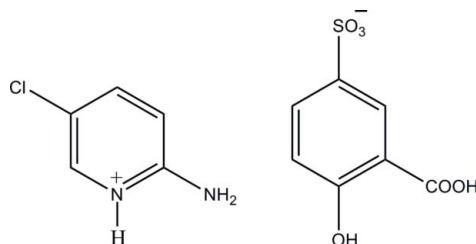

Received 8 August 2010; accepted 11 August 2010

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; disorder in main residue; R factor = 0.051; wR factor = 0.158; data-to-parameter ratio = 17.0.

The asymmetric unit of the title salt, $\text{C}_5\text{H}_6\text{ClN}_2^+\cdot\text{C}_7\text{H}_5\text{O}_6\text{S}^-$, contains two independent 2-amino-5-chloropyridinium cations and two independent 3-carboxy-4-hydroxybenzenesulfonate anions. In both anions, the O atoms of the sulfonate group are disordered over two sets of positions, with occupancy ratios of 0.47 (5):0.53 (5) and 0.50 (8):0.50 (8). In each anion, an intramolecular O—H···O hydrogen bond generating an $S(6)$ motif is observed. In the crystal structure, the cations and anions are linked via N—H···O, O—H···O and C—H···O hydrogen bonds, forming a two-dimensional network parallel to (110). The structure is further stabilized by $\pi-\pi$ interactions between cations and anions [centroid–centroid distance = 3.5454 (12) \AA]. The crystal studied was a non-merohedral twin, with a ratio of the twin components of 0.715 (3):0.285 (3).

2-Amino-5-chloropyridinium 3-carboxy-4-hydroxybenzenesulfonate

Madhukar Hemamalini and Hoong-Kun Fun

S1. Comment

Intermolecular interactions are responsible for crystal packing and gaining an understanding of them allows us to comprehend collective properties and permits the design of new crystals with specific physical and chemical properties (Lam & Mak, 2000). 5-Sulfosalicylic acid (3-carboxy-4-hydroxybenzenesulfonic acid) and its organic complexes or salts can develop well-defined non-covalent supramolecular architectures because of their ability to form multiple hydrogen bonds containing components of complementary arrays of hydrogen-bonding sites (Smith *et al.*, 2004; Muthiah *et al.*, 2003; Raj *et al.*, 2003; Fan *et al.*, 2005). The present study has been undertaken to study the hydrogen bonding patterns involving the 3-carboxy-4-hydroxybenzenesulfonate anions with the 2-amino-5-chloropyridinium cations.

The asymmetric unit of the title compound consists of two crystallographically independent 2-amino-5-chloropyridinium cations (A and B) and two 3-carboxy-4-hydroxybenzenesulfonate anions (A and B) (Fig. 1). Each 2-amino-5-chloropyridinium cation is planar, with a maximum deviation of 0.003 (2) Å for atom C8A in cation A and 0.013 (2) Å for C12B atom in cation B. In the cations, protonation at atoms N1A and N1B lead to a slight increase in the C8A—N1A—C12A [123.3 (2)°] and C8B—N1B—C12B [123.56 (19)°] angles compared to those observed in an unprotonated structure (Pourayoubi *et al.*, 2007). Bond lengths (Allen *et al.*, 1987) and angles are normal. Each 3-carboxy-4-hydroxybenzenesulfonate anions contains an intramolecular O—H···O hydrogen bond, which generates an *S*(6) ring.

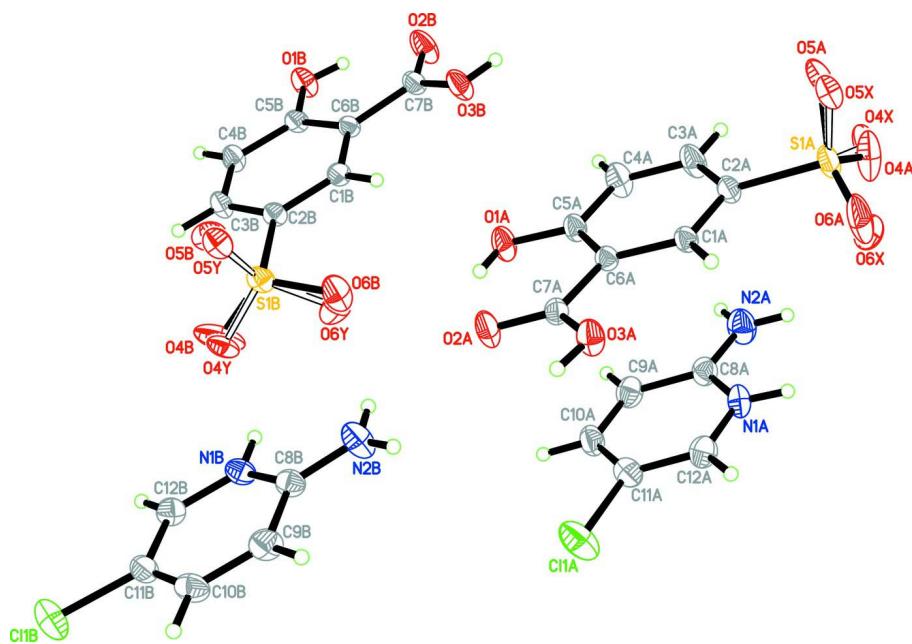

In the crystal structure, (Fig. 2), the sulfonate group of each 3-carboxy-4-hydroxybenzenesulfonate anion interacts with the corresponding 2-amino-5-chloropyridinium cations via a pair of N—H···O hydrogen bonds forming an *R*₂²(8) ring motif (Bernstein *et al.*, 1995). Here, sulfonate groups mimic the role of the carboxylate groups. The ionic units are further linked by N—H···O, O—H···O and C—H···O (Table 1) hydrogen bonds, forming a two dimensional network parallel to the (110) plane.

S2. Experimental

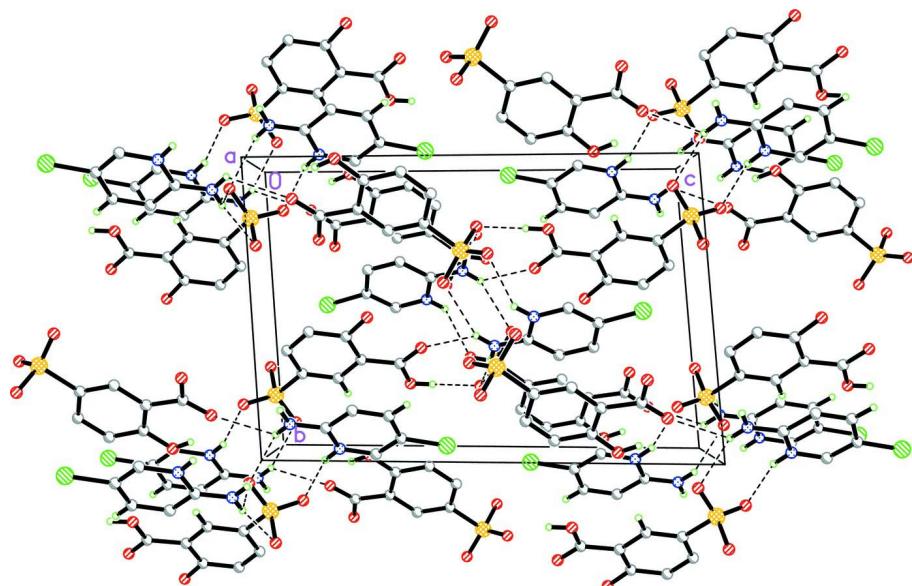

A hot methanol solution (20 ml) of 2-amino-5-chloropyridine (32 mg, Aldrich) and sulfosalicylic acid (54 mg, Merck) were mixed and warmed over a heating magnetic stirrer hotplate for a few minutes. The resulting solution was allowed to cool slowly at room temperature and crystals of the title compound appeared after a few days.

S3. Refinement

Atoms H2OA, H2OB, H1OA, H1OB, H1NA and H1NB were located in a difference Fourier map and refined freely. The remaining H atoms were positioned geometrically [C—H = 0.93 Å] and were refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. The O atoms in the both sulfonate anions are disordered over two sets of positions, with occupancy ratios of 0.47 (5):0.53 (5) and 0.50 (8):0.50 (8). The crystal studied was a non-merohedral twin, the refined ratio of the two components being 0.715 (3):0.285 (3); the twin matrix is [-1 0 0.111, 0 -1 0.111, 0 0 1].

**Figure 1**

The asymmetric unit of the title compound. Displacement ellipsoids are drawn at the 30% probability level. Open bonds indicate minor disordered components.

**Figure 2**

The crystal packing of the title compound, showing a hydrogen-bonded (dashed lines) network. H atoms not involved in the interactions have been omitted for clarity. Only the major component of the disordered O atoms of the sulfonate group are shown.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
