Received 7 July 2010; accepted 20 July 2010

Key indicators: single-crystal X-ray study; $T = 90\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.023; wR factor = 0.063; data-to-parameter ratio = 18.5.

In the polymeric title compound, $\{[\text{Ho}_2(\text{C}_6\text{H}_2\text{O}_4)_3(\text{H}_2\text{O})_6]\cdot18\text{H}_2\text{O}\}_n$, the Ho^{III} ion is nine-coordinated by six O atoms derived from three bidentate 2,5-dihydroxy-1,4-benzoquinonate (DHBQ^{2-}) ligands and three O atoms from three water molecules. The Ho^{III} ions are connected via three ligands, resulting in the formation of a two-dimensional honeycomb layer parallel to the ab plane. The layer is racemic in which Δ - and Λ -coordination geometries around Ho^{III} ions are alternately arranged. The asymmetric unit comprises a third of a Ho^{III} ion, located on a threefold axis, one-half of a DHBQ^{2-} ion, located on a centre of inversion, one coordinated water molecule and three uncoordinated water molecules.

S1. Comment

Lanthanide complexes have attracted attention as magnetic and luminescent materials due to the properties of the $4f$ orbitals in lanthanide ions. Although the magnetism of mononuclear lanthanide complexes are well understood, studies on polynuclear lanthanide complexes are much less advanced (Ohkoshi *et al.*, 2001). The dimensionality of complexes and coordination geometry around lanthanide ions are key factors to control their magnetic properties. From this viewpoint, constructing polynuclear lanthanide complexes with various topologies are interesting. In our previous work, we reported the 3-D monometallic lanthanide metal assembly, $\text{Na}_5[\{\text{Ho}(\text{THB}^4)_2\}.7\text{H}_2\text{O}]_n$ ($\text{THB} = 1,2,4,5$ -tetrahydroxybenzene) (Nakabayashi *et al.*, 2009). In this work, we synthesized a 2-D honeycomb network composed of holmium ions (Ho^{III}) and 2,5-dihydroxy-1,4-benzoquinonate, $[\{\text{Ho}_2(\text{DHBQ}^2)_3(\text{H}_2\text{O})_6\}.18\text{H}_2\text{O}]_n$ (Kitagawa *et al.*, 2002; Robl *et al.*, 1988).

The asymmetric unit comprises a third of a Ho^{III} ion, being located on a three-fold axis, one-half of a DHBQ^{2-} ion, being disposed about a centre of inversion, one coordinated water molecule, and three zeolitic water molecules.

The C—O distances of 1.276 (4) Å (C1—O1) and 1.274 (3) Å (C2—O2) in this compound agree with those of the DHBQ^{2-} ligands which were previously reported, *e.g.* 1.276 (6) Å (Weiss *et al.* 1986). In the coordination geometry, a Ho^{III} ion is coordinated to six O atoms from three bidentate DHBQ^{2-} ligands and three O atoms from three water molecules (Fig. 1 and Table 1). The Ho^{III} ion is connected *via* three ligands, which results in a two-dimensional honeycomb layer with a diameter of 16.6 Å. The layer has a racemic structure in which Δ - and Λ -coordination geometries around Ho^{III} ions are alternately arranged (Fig. 2). The zeolitic water molecules occupy regions between the layers.

The product of the molar magnetic susceptibility (χ_M) and temperature (T), $\chi_M T$, values at room temperature was 13.6 cm³ K mol⁻¹. This value nearly corresponds to the expected value of 13.9 cm³ K mol⁻¹ due to Ho^{III} ions ($J = 8$, $L = 6$, $S = 2$, and $g = 5/4$).

All known compounds of this type have two specific structures, honeycomb or racemic, and show paramagnetism. Mixing lanthanide ions, the chiral lanthanide assemblies with Δ - or Λ -coordination geometries are targeted for synthesis, which should show a magneto-chiral dichroism. A study to clarify this hypotheses, work is currently under way.

S2. Experimental

Under air, aqueous solutions of 0.1 M $\text{Ho}(\text{NO}_3)_3$ and 0.4 M 1,2,4,5-tetrahydroxybenzene (THB) (Weider *et al.*, 1985) mixed. THB was gradually oxidized to 2,5-dihydroxy-1,4-benzoquinone (DHBQ) in the mixed solution, and slow complexation of $\text{Ho}(\text{NO}_3)_3$ and DHBQ produced red crystals of the title polymer in 24% yield within a week. The obtained polycrystalline compound was dried under air. Elemental analysis indicated the formula was $[\text{Ho}_2(\text{C}_6\text{H}_2\text{O}_4)_3(\text{H}_2\text{O})_6].17\text{H}_2\text{O}$, $\text{C}_{18}\text{H}_{52}\text{O}_{35}\text{Ho}_2$, calcd. Ho, 28.18%; C, 18.47%; H, 4.49%, found. Ho, 28.29%; C, 18.23%; H, 4.64%. There is a slight difference of zeolitic water molecules between the elemental analysis and the crystallographic

formulation because zeolitic water molecules are easy to be lost from the crystals and their number depends on the drying processes.

S3. Refinement

The H atoms were placed in their calculated positions, with C—H = 0.95 Å, and refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$.

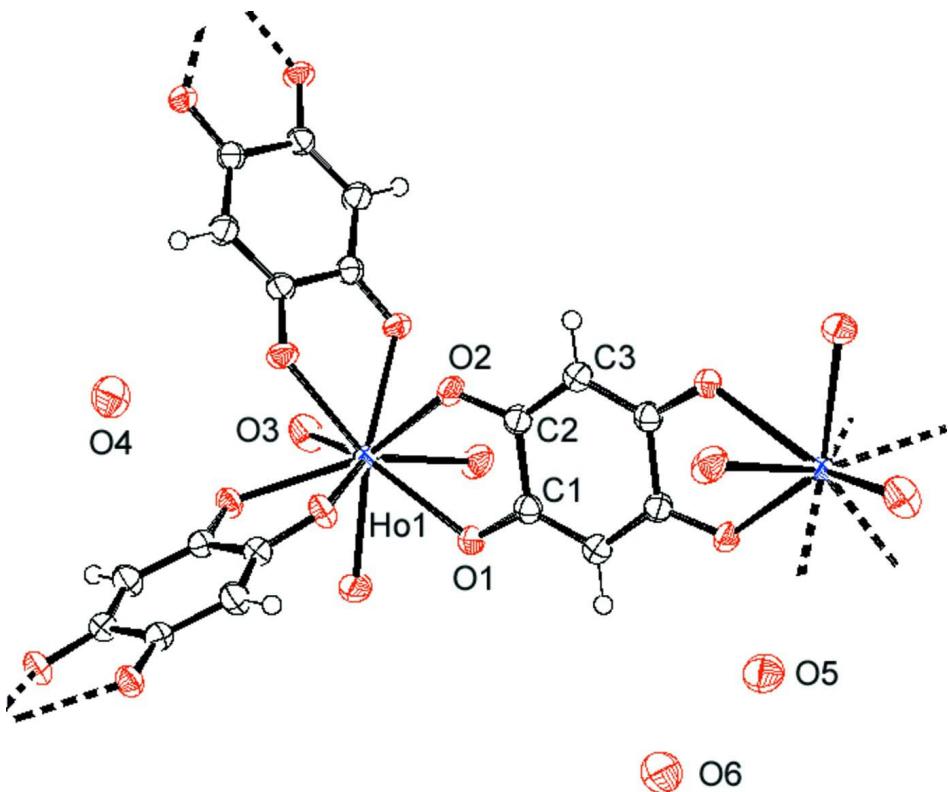

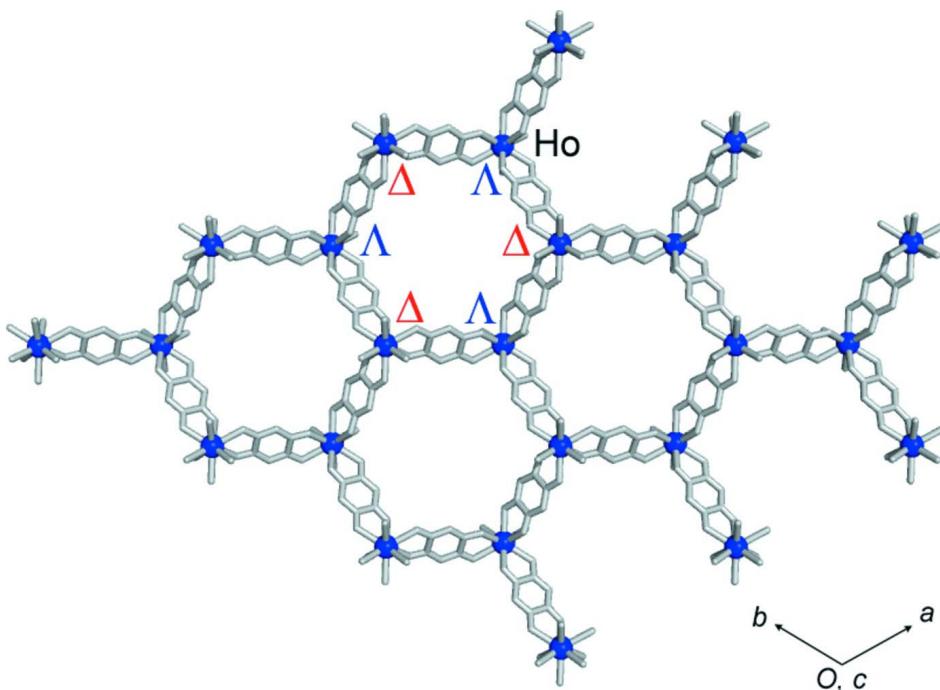

Figure 1

A part of the title polymeric compound, thermal ellipsoids are shown at the 50% probability level. Blue, gray, and red represent Ho, C and O atoms, respectively. The labeled atoms indicate all independent atoms.

**Figure 2**

A layer with a honeycomb structure. Blue spheres and gray sticks represent Ho atoms and other atoms (C and O), respectively.

Refinement. Refinement was performed using all reflections. The weighted *R*-factor (*wR*) and goodness of fit (*S*) are based on F^2 . *R*-factor (gt) are based on *F*. The threshold expression of $F^2 > 2.0 \sigma(F^2)$ is used only for calculating *R*-factor (gt).
