Received 28 October 2010; accepted 1 November 2010

Key indicators: single-crystal X-ray study;  $T = 173\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.012\text{ \AA}$ ;  $R$  factor = 0.100;  $wR$  factor = 0.313; data-to-parameter ratio = 12.9.

The title compound,  $[\text{Li}_3(\text{C}_4\text{F}_9\text{O})_3(\text{C}_3\text{H}_6\text{O})_3]$ , features an open Li/O cube with an Li ion missing at one corner. Three of the four bridging O atoms of the cube carry a fluorinated *tert*-butyl residue, whereas the fourth is part of an acetone molecule. Two of the Li atoms are further bonded to a non-bridging acetone molecule. Two of the lithium ion coordination geometries are very distorted  $\text{LiO}_4$  tetrahedra; the third could be described as a very distorted  $\text{LiO}_3$  T-shape with two distant F-atom neighbours. The Li···Li contact distances for the three-coordinate  $\text{Li}^+$  ion [2.608 (14) and 2.631 (12)  $\text{\AA}$ ] are much shorter than the contact distance [2.940 (13)  $\text{\AA}$ ] between the tetrahedrally coordinated species.

## $\mu_2$ -Acetone-diacetone[ $\mu_3$ -tris(trifluoromethyl)methanolato]bis[ $\mu_2$ -tris(trifluoromethyl)methanolato]trilithium

Hannes Vitze, Hans-Wolfram Lerner and Michael Bolte

### S1. Comment

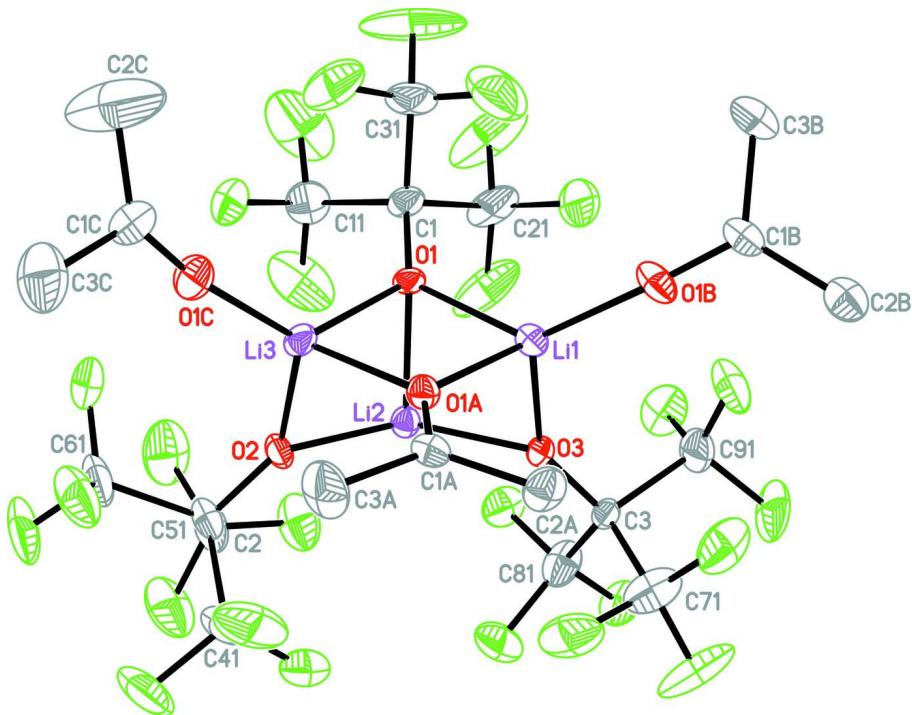

Weakly coordinating anions have gained prominence in wide areas of application in research laboratories and industry. One approach is to create such anions by tetrasubstitution of triole derivatives with perfluorinated alkoxides as  $[\text{OC}(\text{CF}_3)_3]^-$  (Reisinger *et al.*, 2007) or with siloxides  $[\text{OSiR}_3]^-$  ( $R = \text{alkyl}$ ) (Kern *et al.*, 2008; Lerner *et al.*, 2005, 2002). In this paper we report the crystal structure of the adduct of  $\text{Li}[\text{OC}(\text{CF}_3)_3]$  with acetone,  $[\text{Li}(\text{OC}(\text{CH}_3)_2)_3\text{OC}(\text{CF}_3)_3]_3$ , (I). According to a literature procedure (Reisinger *et al.*, 2007),  $\text{Li}[\text{OC}(\text{CF}_3)_3]$  was easily accessible from the reaction of  $\text{HOC}(\text{CF}_3)_3$  with  $\text{LiH}$ . Single crystals of (I) were obtained by recrystallization from acetone. Only one comparable cage structure was found in the Cambridge Crystallographic Database, *i.e.* ( $\mu_3$ -1,1-diphenylethoxo)-tris( $\mu_2$ -1,1-diphenylethoxo)-bis(1,1-diphenylethoxy)-tri-magnesium toluene solvate (Zechmann *et al.*, 2001). The title compound features an open Li—O cube with an Li ion missing at one corner. Three of the four bridging O atoms carry a *tert*-butyl residue whereas the fourth is part of an acetone molecule. The two four-coordinated Li atoms are further bonded to an acetone molecule. This is the first example of such an Li—O skeleton and only one comparable structure was determined up to now containing Mg instead of Li as metal atoms.

### S2. Experimental

$\text{LiH}$  (0.34 g, 43.7 mmol) and  $\text{Et}_2\text{O}$  (100 ml) were combined under an  $\text{N}_2$  atmosphere.  $\text{Li}[\text{OC}(\text{CF}_3)_3]$  (6.1 ml, 43.8 mmol) was added dropwise at ambient temperature. After 1 h at ambient temperature, the solution was heated under reflux for 2 h. Colourless blocks of (I) were obtained by recrystallization from acetone Yield: 6.1 g (50%).

### S3. Refinement

H atoms were located in a difference map, but geometrically positioned and refined using a riding model with fixed individual displacement parameters [ $U(\text{H}) = 1.2 U_{\text{eq}}(\text{C}, \text{N})$ ] and with  $\text{N}—\text{H} = 0.88\text{\AA}$  and  $\text{C}—\text{H} = 0.95\text{\AA}$ . The highest peak ( $2.75\text{ e \AA}^{-3}$ ) in the final difference electron density map is at  $1.36\text{\AA}$  from Br1.

**Figure 1**

Perspective view of the title compound with displacement ellipsoids drawn at the 20% probability level; H atoms are omitted for clarity.

$$(\Delta/\sigma)_{\max} < 0.001$$

$$\Delta\rho_{\max} = 0.65 \text{ e \AA}^{-3}$$

$$\Delta\rho_{\min} = -0.43 \text{ e \AA}^{-3}$$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
