Received 19 November 2010; accepted 26 November 2010

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$ ;  $R$  factor = 0.032;  $wR$  factor = 0.085; data-to-parameter ratio = 15.3.

In the crystal structure of the title compound,  $\{[\text{Cd}(\text{C}_2\text{Cl}_3\text{O}_2)_2(\text{C}_{12}\text{H}_{10}\text{N}_2)_2]\cdot\text{H}_2\text{O}\}_n$ , the  $\text{Cd}^{II}$  ion lies on a twofold rotation axis and 1,2-bis(4-pyridyl)ethene ligands bridge symmetry-related  $\text{Cd}^{II}$  ions, forming a two-dimensional structure. Two trichloroacetate ligands complete the coordination around the  $\text{Cd}^{II}$  ion, forming a distorted octahedral environment. In the crystal, solvent water molecules, which also lie on twofold rotation axes, form intermolecular  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds, which connect the two-dimensional structure into a three-dimensional network. The crystal studied was an inversion twin, the refined ratio of twin components being 0.75 (4):0.25 (4).

## Poly[[bis[ $\mu$ -1,2-bis(4-pyridyl)ethene]bis(trichloroacetato)cadmium(II)] monohydrate]

Jin Hoon Kim, Cheal Kim and Youngmee Kim

### S1. Comment

Self-assembly processes involving metal ions and organic ligands directed by either metal coordination or hydrogen bonds have attracted much attention in the field of supramolecular chemistry and current coordination chemistry (Batten, *et al.*, 1998; Moler, *et al.*, 2001; Moulton, *et al.*, 2001; Kim, *et al.*, 2002; Evans, *et al.*, 2002). The use of rigid or flexible spacer ligands is of considerable interests in recent years owing to their potential as building blocks for supramolecular assemblies (Sauvage, *et al.*, 1995; Fujita, *et al.*, 2001; Aromí, *et al.*, 2006) and their ability to act as optical sensors and heterogeneous catalysts (Yoo, *et al.*, 2003; Takizawa, *et al.*, 2003; Hong, *et al.*, 2004; Kitagawa, *et al.*, 2004; Hong, *et al.*, 2005; Han, *et al.*, 2006). In our attempt to investigate the design and control of the self-assembly of coordination polymers with the rigid bridging ligands, we have employed Cd<sup>II</sup> to develop a new polymeric complex with the ligand 1,2-bis(4-pyridyl)ethene. We report herein the crystal structure of the title compound  $[\text{Cd}(\text{O}_2\text{C}_2\text{Cl}_3)_2(\text{C}_{12}\text{H}_{10}\text{N}_2)_2]_n$  ( $\text{C}_{12}\text{H}_{10}\text{N}_2$ = 1,2-bis(4-pyridyl)ethene).

The asymmetric unit of the title compound is shown in Fig. 1. The unique Cd<sup>II</sup> ion lies on a twofold rotation axis and 1,2-bis(4-pyridyl)ethene ligands bridge symmetry related Cd<sup>II</sup> ions to form a two-dimensional structure (Fig. 2). Two trichloroacetato ligands complete the coordination around the Cd<sup>II</sup> ion to form a distorted octahedral environment. In the crystal structure solvent water molecules, which also lie on twofold rotation axes, form intermolecular O-H···O hydrogen bonds which connect the two-dimensional structure into a three-dimensional network.

### S2. Experimental

39.3 mg (0.125 mmol) of Cd(NO<sub>3</sub>)<sub>2</sub>·4H<sub>2</sub>O and 41.3 mg (0.25 mmol) of CCl<sub>3</sub>COOH and 15.8 mg (0.125 mmol) of NH<sub>4</sub>OH were dissolved in 4 ml water and carefully layered by 4 ml ethanol of 1,2-bis(4-pyridyl)ethene ligand (47.0 mg, 0.25 mmol). Suitable crystals of the title compound for X-ray analysis were obtained in a month.

### S3. Refinement

H atoms were placed in calculated positions with C—H distances of 0.93 Å (phenyl). They were included in the refinement in riding-motion approximation with U<sub>iso</sub>(H)=1.2U<sub>eq</sub>(C). The unique H atom bonded to the water molecule was refined independently with an isotropic displacement parameter.

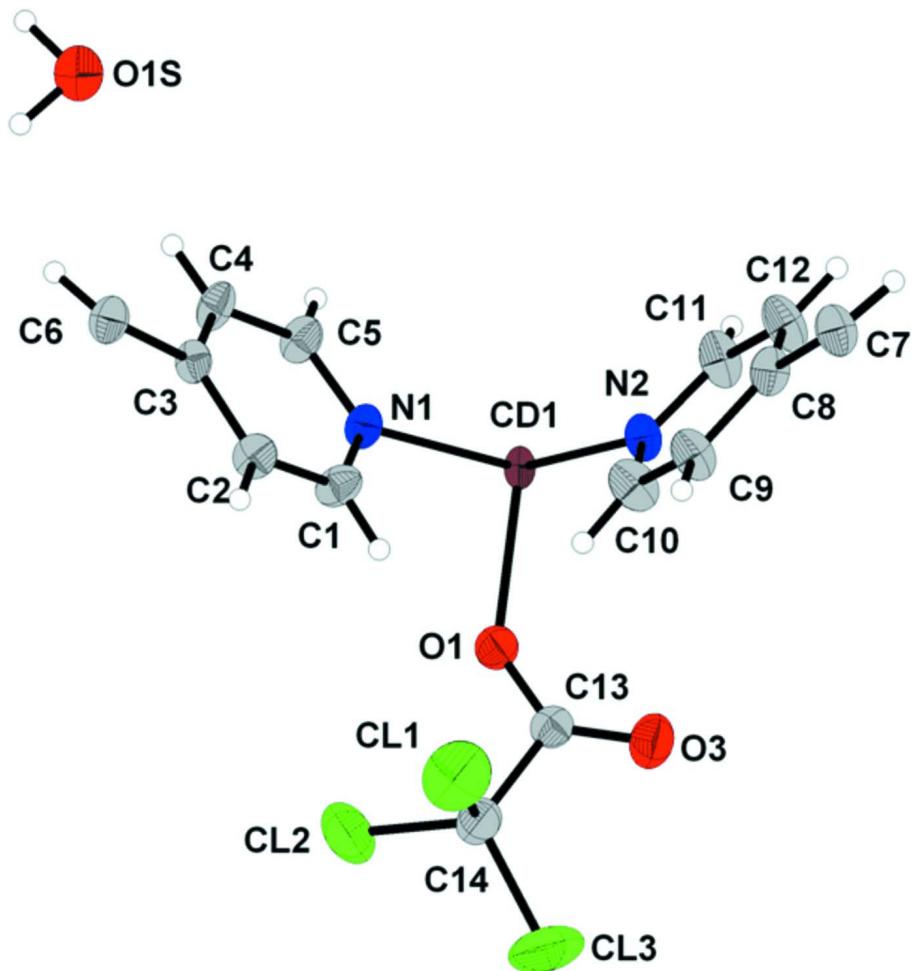

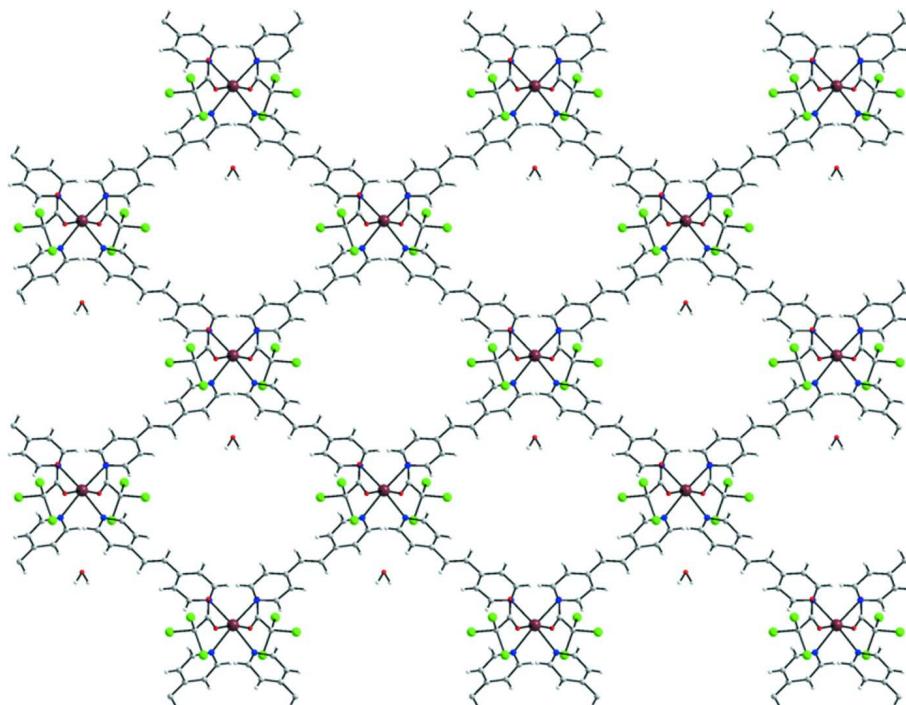

Figure 1

The asymmetric unit of the title compound with labeling scheme. Displacement ellipsoids are shown at the 50% probability level. The water molecule in the asymmetric unit is half occupancy.

**Figure 2**

Part of a two-dimensional sheet of the title compound.

 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} < 0.001$   
 $\Delta\rho_{\max} = 0.69 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.49 \text{ e } \text{\AA}^{-3}$   
 Absolute structure: Flack (1983), 1477 Friedel pairs  
 Absolute structure parameter: 0.25 (4)

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
