Received 24 January 2011; accepted 26 January 2011

Key indicators: single-crystal X-ray study; $T = 299$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.037; wR factor = 0.098; data-to-parameter ratio = 15.3.

In the title compound, $\text{C}_{12}\text{H}_{17}\text{NO}_3\text{S}$, the amide H atom is *syn* to the *ortho*-methyl group of the benzene ring and the C—S—N—C torsion angle is -65.39 (17)°. The crystal structure features inversion-related dimers linked by pairs of N—H···O hydrogen bonds in which the acceptor O atom is bound to the S atom.

Related literature

Sulfonamide drugs contain the sulfanilamide moiety (Maren, 1976). Their tendency and preferences for hydrogen bonding in the solid state can give rise to polymorphism, see: Yang & Guillory (1972); Adsmond & Grant (2001). For our studies on the effect of substituents on the crystal structures of this class of compounds, see: Gowda *et al.* (2008a,b, 2010).

2,2-Dimethyl-N-(2-methylphenylsulfonyl)propanamide

K. Shakuntala, Sabine Foro and B. Thimme Gowda

S1. Comment

The molecular structures of sulfonamide drugs contain the sulfanilamide moiety (Maren, 1976), and their propensity for hydrogen bonding in the solid state, due to the presence of various hydrogen bond donors and acceptors, can give rise to polymorphism (Yang & Guillory, 1972; Adsmond & Grant, 2001). Hence, the nature and position of substituents play a significant role on the crystal structures of *N*-(aryl)sulfonamides. As a part of a study of the substituent effects on the crystal structures of this class of compounds (Gowda *et al.*, 2008*a,b*, 2010), the structure of *N*-(2-methylphenylsulfonyl)-2,2,2-trimethylacetamide (**I**) has been determined.

The N—H and C=O bonds are *anti* to each other (Fig. 1), as observed in each of *N*-(phenylsulfonyl)acetamide (**II**) (Gowda *et al.*, 2010), *N*-(phenylsulfonyl)-2,2,2-trimethylacetamide (**III**) (Gowda *et al.*, 2008*b*) and *N*-(4-methylphenylsulfonyl)-2,2,2-trimethylacetamide (**IV**) (Gowda *et al.*, 2008*a*). Further, the amide hydrogen is *syn* to the *ortho*-methyl group in the benzene ring. The molecule in (**I**) is bent at the S-atom with the C1—S1—N1—C7 torsion angle being -65.39 (17)°, compared to the values of -58.8 (4)° in (**II**), -64.5 (3)° in (**III**) and -68.2 (2)° in (**IV**).

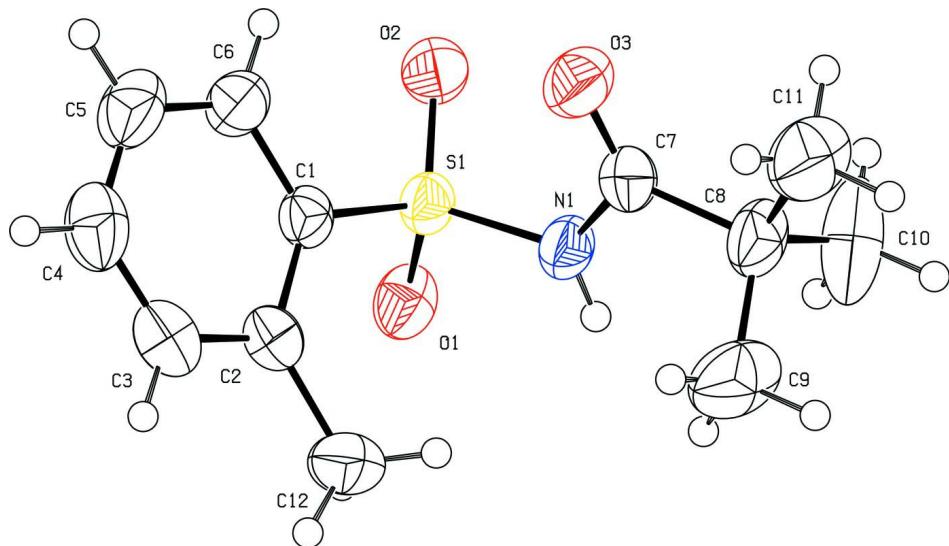

In the crystal structure, the pairs of intermolecular N—H···O hydrogen bonds (Table 1) link inversion-related molecules into dimeric aggregates where the acceptor O atom is bound to the S atom; Fig. 2.

S2. Experimental

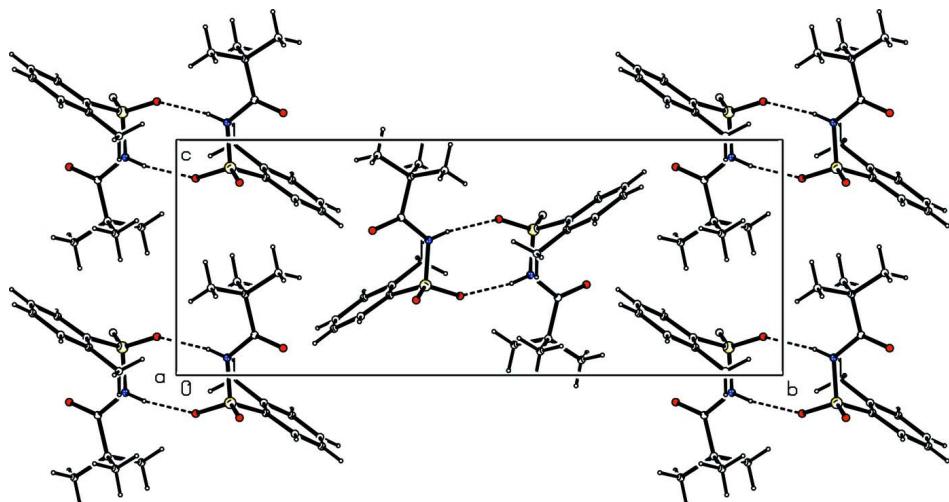

Compound (**I**) was prepared by refluxing 2-methylbenzenesulfonamide (0.10 mole) with an excess of pivalyl chloride (0.20 mole) for about an hour on a water bath. The reaction mixture was cooled and poured into ice cold water. The resulting solid was separated, washed thoroughly with water and dissolved in warm dilute sodium hydrogen carbonate solution. Compound (**I**) was reprecipitated by acidifying the filtered solution with glacial acetic acid. It was filtered, dried and recrystallized from ethanol. Prism like red crystals were obtained from a slow evaporation of an ethanolic solution of (**I**).

S3. Refinement

The amide-H atom was located in a difference map and refined with the distance restraint N—H = 0.86 (2) Å. The other H atoms were positioned with idealized geometry using a riding model with C—H = 0.93–0.96 Å. All H atoms were refined with isotropic displacement parameters (set to 1.2 times of the U_{eq} of the parent atom).

**Figure 1**

Molecular structure of (I), showing the atom- labelling scheme. Displacement ellipsoids are drawn at the 50% probability level.

**Figure 2**

Molecular packing for (I) viewed in projection down the *a* axis. Hydrogen bonds are shown as dashed lines.

Extinction coefficient: 0.0174 (8)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
