Received 13 February 2011; accepted 14 March 2011

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.046; wR factor = 0.127; data-to-parameter ratio = 17.2.

The P atom in the title compound, $\text{C}_{21}\text{H}_{21}\text{FN}_3\text{O}_2\text{P}$, is in a tetrahedral coordination environment and the environment of each N atom is essentially planar (sums of angles = 359.7, 359.9 and 358.4°). The phosphoryl and carbonyl groups adopt *anti* orientations with respect to each other. In the crystal, adjacent molecules are linked via $\text{N}-\text{H}\cdots\text{O}=\text{P}$ and two $\text{N}-\text{H}\cdots\text{O}=\text{C}$ hydrogen bonds into an extended chain parallel to the a axis.

Related literature

S1. Comment

Carbacylamidophosphates with a C(O)NHP(O) skeleton have attracted attention because of their roles as the *O,O'*-donor ligands for metal complexation (Gholivand *et al.*, 2010). Following the previous works about carbacylamidophosphates such as P(O)[NHC(O)C₆H₃(2,6-F₂)][N(CH₃)(CH₂C₆H₅)]₂ (Pourayoubi *et al.*, 2010), here, we report on the synthesis and crystal structure of the title compound, P(O)[NHC(O)C₆H₄(2-F)][NH—C₆H₄-4-CH₃]₂.

In the crystal structure of the title compound the phosphoryl and carbonyl groups adopt *anti* positions to each other. The P atom has a slightly distorted tetrahedral configuration (Fig. 1). The bond angles around the P atom are in the range of 101.09 (8)° to 116.67 (8)°. The P1—N2 and P1—N3 bonds (1.6361 (15) Å and 1.6291 (17) Å) are shorter than the P1—N1 bond (1.6872 (15) Å). The environment of the nitrogen atoms is essentially planar. The P=O bond length of 1.4723 (13) Å is comparable to those in similar compounds *e.g.* in P(O)[NHC(O)C₆H₄(4-NO₂)][NHC₆H₁₁]₂ (Sabbaghi *et al.*, 2010).

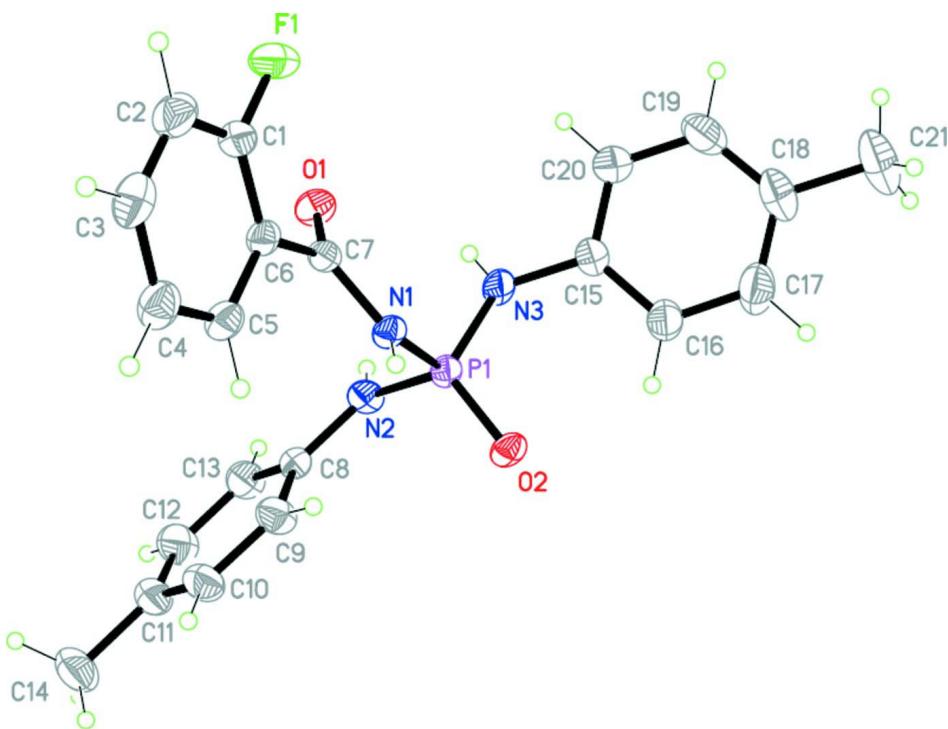

In the crystal structure, adjacent molecules are linked via N_{C(O)NHP(O)}—H···O=P and two N_{amide}—H···O=C hydrogen bonds (see Table 1), into an extended chain parallel to the *a* axis.

S2. Experimental

2-F—C₆H₄C(O)NHP(O)Cl₂ has been synthesized from the reaction between phosphorus pentachloride (4.0 g, 19.2 mmol) and 2-fluorobenzamide (2.671 g, 19.2 mmol) in dry CCl₄ at 358 K (3 h) and then the treatment of formic acid (0.884 g, 19.2 mmol) at ice bath temperature. To a solution of 2-F—C₆H₄C(O)NHP(O)Cl₂ (0.3 g, 1.17 mmol) in dry chloroform (30 ml), a mixture of *p*-toluidine (0.251 g, 2.34 mmol) and triethylamine (0.237 g, 2.34 mmol) in dry chloroform (10 ml) was added at 273 K. After 4 h stirring, the solvent was removed and the product was washed with distilled water and recrystallized from methanol/chloroform at room temperature. IR (KBr, cm⁻¹): 3308 (NH), 3030 (NH), 2896, 2627, 1639 (C=O), 1457, 1220, 1061, 944, 795.

S3. Refinement

Hydrogen atoms H1N, H2N, and H3N were located in Fourier difference map and were refined with *DFIX* 0.88 (0.01) for the N—H bond lengths and isotropic displacement parameter of 1.2 times *U*_{eq} of the parent N atoms. All other hydrogen atoms were placed in their calculated positions with atom—H lengths of 0.95 Å (CH) and 0.98 Å (CH₃) and isotropic displacement parameters for these atoms were set to 1.20 times (CH) and 1.50 times (CH₃) *U*_{eq} of the parent C atom.

**Figure 1**

An *ORTEP*-style plot of title compound with labeling. Displacement ellipsoids are drawn at the 50% probability level.

264 parameters

3 restraints

Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites

H atoms treated by a mixture of independent and constrained refinement

$$w = 1/[\sigma^2(F_o^2) + (0.0669P)^2 + 0.498P]$$

where $P = (F_o^2 + 2F_c^2)/3$

$$(\Delta/\sigma)_{\max} = 0.007$$

$$\Delta\rho_{\max} = 0.41 \text{ e } \text{\AA}^{-3}$$

$$\Delta\rho_{\min} = -0.26 \text{ e } \text{\AA}^{-3}$$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
