Received 19 March 2011; accepted 31 March 2011

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.024; wR factor = 0.055; data-to-parameter ratio = 37.4.

The asymmetric unit of the title *triangulo*-triruthenium compound, $Ru_3(CO)_9(\mu\text{-}Ph_2AsCH_2AsPh_2)(P[OCH(CH_3)_2]_3)$ or $[Ru_3(C_{25}H_{22}As_2)(C_9H_{21}O_3P)(CO)_9]$, contains two molecules of the *triangulo*-triruthenium complex. The bis(diphenylarsanyl)methane ligand bridges an Ru—Ru bond and the monodentate phosphite ligand binds to the third Ru atom. Both the arsine and phosphite ligands are equatorial with respect to the Ru_3 triangle. Additionally, each Ru atom carries one equatorial and two axial terminal carbonyl ligands. The dihedral angles between the pairs of benzene rings bound to individual As atoms are 85.67 (8) and 75.91 (8) in the first independent molecule and 74.64 (8) and 70.76 (9) in the second. In the crystal, molecules are linked into a three-dimensional framework by intermolecular C—H···O hydrogen bonds.

S1. Comment

Syntheses and crystal structures of substituted *triangulo*-triruthenium clusters have been of interest to researchers due to structural variations and catalytic activities. A large number of substituted derivatives, $Ru_3(CO)_{12-n}L_n$ (L = group 15 ligand) have been reported (Bruce *et al.*, 1988). As part of our ongoing studies (Shawkataly *et al.*, 2011), we report here a mixed-ligand metal-carbonyl cluster complex, $Ru_3(CO)_9(\mu\text{-}Ph_2AsCH_2AsPh_2)(P[OCH(CH_3)_2]_3)$.

The asymmetric unit consists of two crystallographically independent molecules (Fig. 1) of the *triangulo*-triruthenium complex, A and B. Fig. 2 shows the atom numbering scheme for molecule A. Atoms of molecule B were labelled similarly. The bond lengths and angles of the title compound are comparable to those found in its related structure (Shawkataly *et al.*, 1998). The bis(diphenylarsino)methane ligand bridges the Ru1 – Ru2 bond and the monodentate phosphite ligand bonds to the Ru3 atom. Both the phosphite and arsine ligands are equatorial with respect to the Ru_3 triangle. Additionally, each Ru atom carries one equatorial and two axial terminal carbonyl ligands. The dihedral angles between the two benzene rings (C1-C6/C7-C12 & C14-C19/C20-C25) are 85.67 (8), 75.91 (8) and 74.64 (8), 70.76 (9) for the two diphenylarsanyl groups of molecule A and B, respectively.

In the title compound, one of the Ru – Ru bonds is noticeably longer compared to the other two Ru – Ru bonds. The unevenness in the lengths of Ru – Ru bonds in comparison with those of the $Ru_3(CO)_{12}$ structure (Churchill *et al.*, 1977), can be attributed to the steric effect induced by the bulky substituent. In the crystal, molecules are linked into a three-dimensional framework by intermolecular C—H···O weak intearctions. (Fig. 3).

S2. Experimental

All manipulations were performed under a dry, oxygen-free dinitrogen atmosphere using standard Schlenk techniques. All solvents were dried over sodium and distilled from sodium benzophenone ketyl under nitrogen (Bruce *et al.*, 1987). Isopropyl phosphite was used as received and bis(diphenylarsino)methane (Bruce *et al.*, 1983) was prepared by the reported procedure.

Equimolar quantities of $Ru_3(CO)_{10}(\mu\text{-}Ph_2AsCH_2AsPh)$ and isopropyl phosphite were refluxed in THF under nitrogen for 20 minutes. The reaction mixture turned intense red. The solvent was removed under vacuum. The reaction mixture was separated by TLC (dichloromethane:hexane, 1:3). Two bands appeared. The major band (red) R_f = 0.61 was separated and characterized. The compound was crystallised from CH_2Cl_2- CH_3OH, 1:3 yield = 55.2 %, m.p. 189°C. IR(cyclohexane): v (CO) 2127s, 2059 vs, 2042 s, 2017 s, 1988 s cm^{-1}.

S3. Refinement

All hydrogen atoms were positioned geometrically and refined using a riding model with C—H = 0.93–0.98 Å and $U_{iso}(H) = 1.2U_{eq}(C)$ and $1.5U_{eq}$ (C of methyl group).

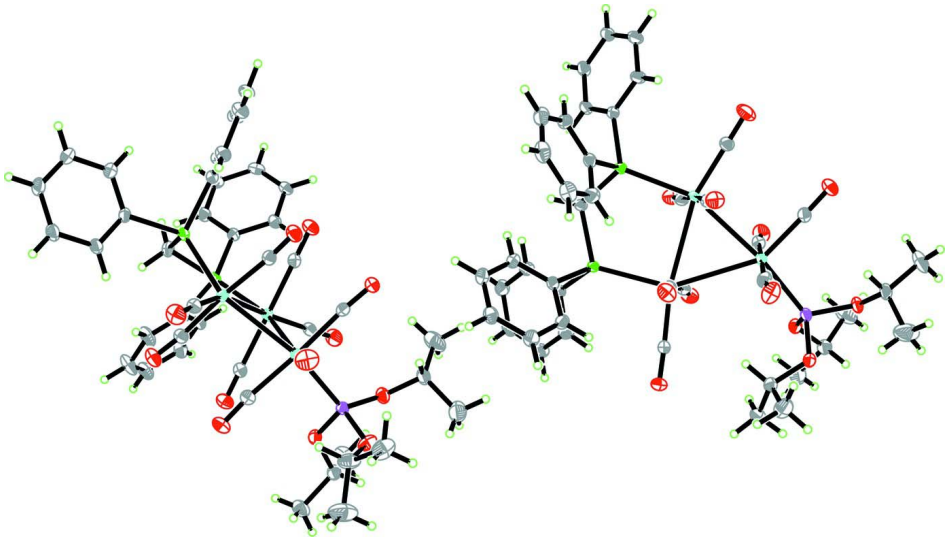

Figure 1

The asymmetric unit, showing 50% probability displacement ellipsoids.

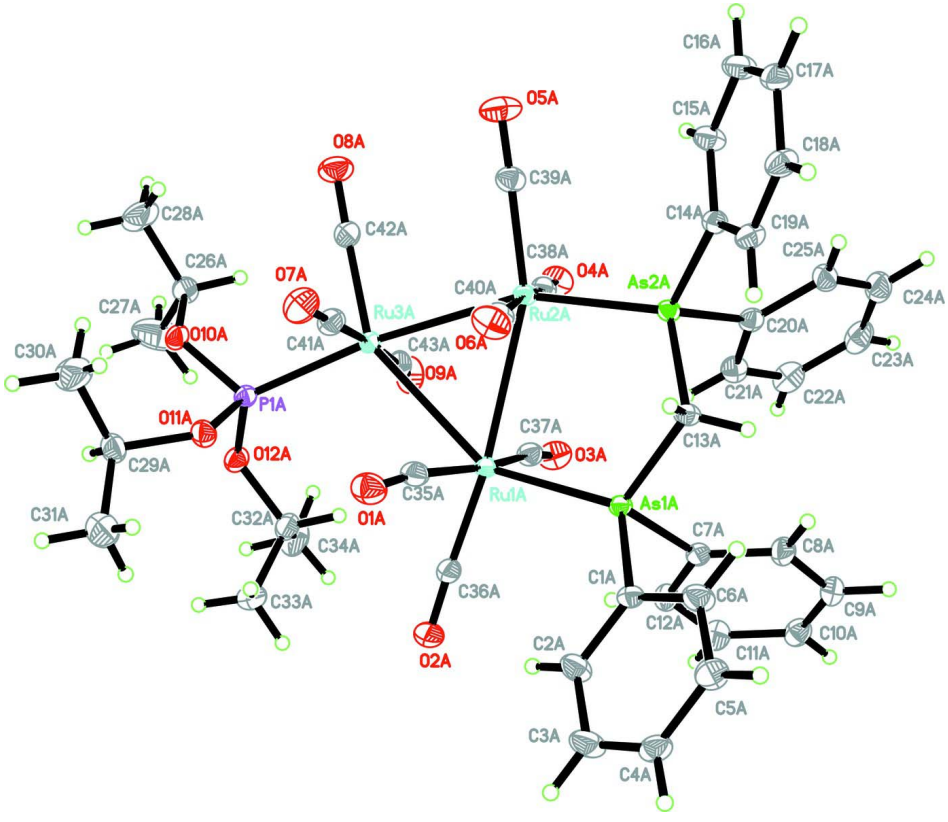

Figure 2

The structure of molecule A, showing 50% probability displacement ellipsoids and the atom-numbering scheme. Atoms in molecule B are similarly labelled.

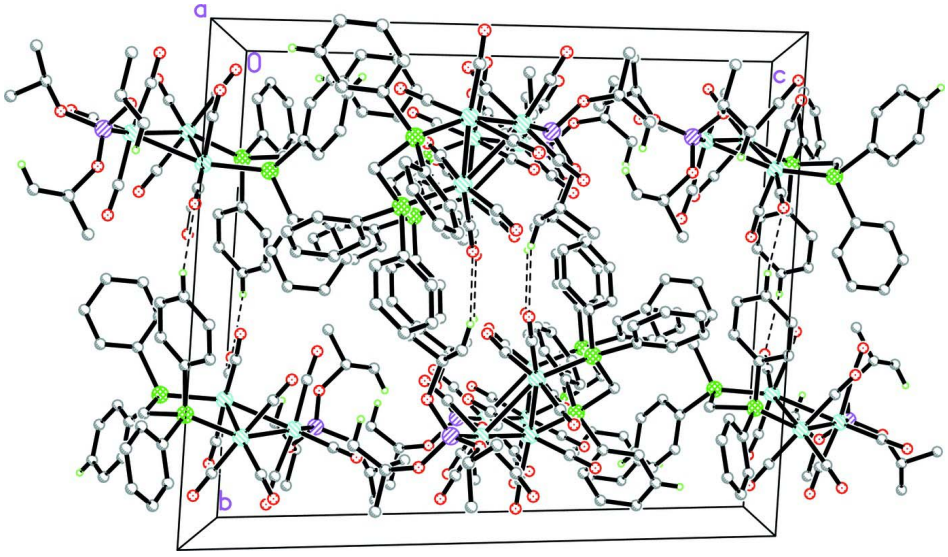

Figure 3

The crystal packing of (I) viewed along the c axis. Dashed lines indicate hydrogen bonds. H atoms not involved in the hydrogen bond interactions have been omitted for clarity.

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cyrosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (Å²)
