Correspondence e-mail: zhiqpan@163.com

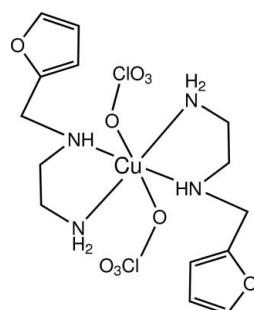

Received 23 March 2011; accepted 1 April 2011

Key indicators: single-crystal X-ray study; $T = 291\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; R factor = 0.049; wR factor = 0.112; data-to-parameter ratio = 13.5.

In the title complex, $[\text{Cu}(\text{ClO}_4)_2(\text{C}_7\text{H}_{12}\text{N}_2\text{O})_2]$, the Cu(II) ion lies on a crystallographic inversion centre. The coordination sphere around Cu(II) ion can be described as tetragonally distorted octahedral with two perchlorate O atoms occupying the apical positions and four N atoms from two N^1 -(2-furylmethyl)ethane-1,2-diamine ligands in the basal plane.

Bis[N-(2-furylmethyl)ethane-1,2-diamine]bis(perchlorato)copper(II)

Wei Xiao, Shi-Rong Li, Hong Zhou, Zhi-Quan Pan and Qimao Huang

S1. Comment

Recently, study of copper complex with polyamine has been given considerable attention (Souza *et al.*, 2009; Patra *et al.*, 2007; Zhou *et al.*, 2009). In this paper, we report on the synthesis and the crystal structure determination of the title complex obtained by the reaction of Cu(ClO₄)₂·6H₂O with the polyamine ligand N¹-(furan-2-ylmethyl)ethane-1,2-diamine.

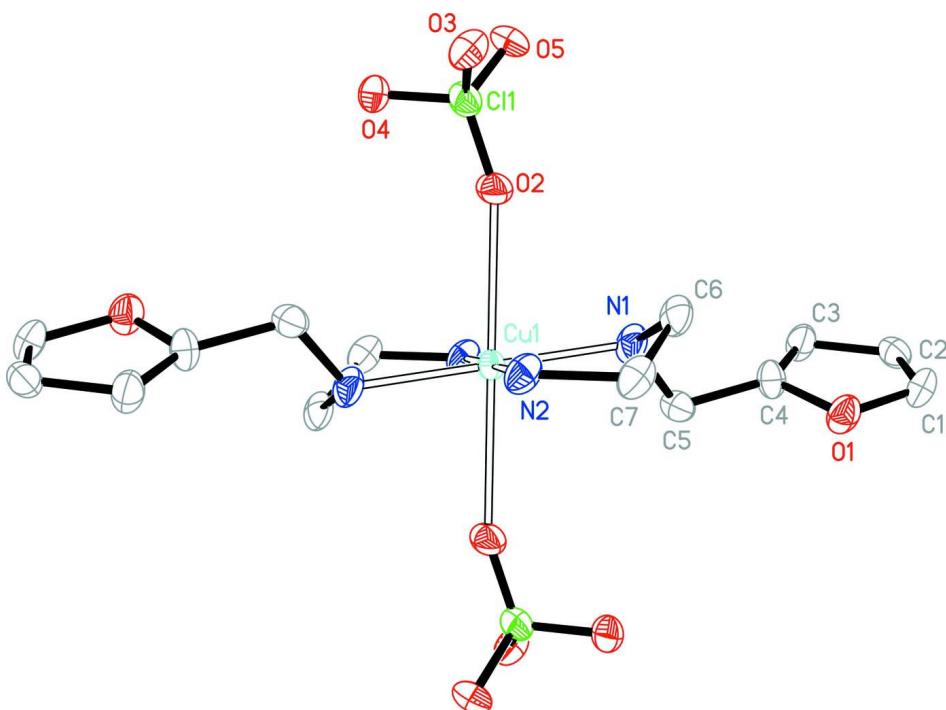

In the title complex, [Cu(C₁₄H₂₄N₄O₂)₂](ClO₄)₂, the Cu(II) ion lies on a crystallographic inversion centre. The coordination sphere around Cu(II) ion can be best described as slightly distorted octahedral. The basal plane is composed of four nitrogen atoms from the two polyamine ligands with the Cu-N distances of 2.001 (4) and 2.049 (4) Å. The apical positions are occupied by two oxygen atoms from two perchlorate anions with a Cu-O distance of 2.492 (4) Å.

S2. Experimental

N¹-(furan-2-ylmethyl)ethane-1,2-diamine (L) was prepared according to the literature method (Wang *et al.*, 2009). Cu(ClO₄)₂·6H₂O (0.25 mmol, 0.093 g) dissolved in 10 ml H₂O was added dropwise to a solution of L (0.5 mmol, 0.071 g) in 10 ml H₂O. The mixture was stirred at ambient temperature for about 12 h and filtrated. The light blue crystals suitable for X-ray diffraction were obtained by the slow evaporation of the mother solution at ambient temperature for 3 weeks.

S3. Refinement

All H atoms for C-H distances were placed in calculated positions and included in the refinement in the riding-model approximation, with *U*(H) set to -1.2*U*_{eq} of the parent atom.

**Figure 1**

A view of the title complex cation, with displacement ellipsoids at the 30% probability level. H atoms are excluded for clarity. Unlabelled atoms are related to labelled atoms by inversion symmetry.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
