Received 17 June 2011; accepted 1 July 2011

Key indicators: single-crystal X-ray study; $T = 223$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.040; wR factor = 0.124; data-to-parameter ratio = 13.6.

The asymmetric unit of the title compound, $\text{C}_{11}\text{H}_{11}\text{N}_3\text{O}_2 \cdot 0.25\text{H}_2\text{O}$, contains two independent organic molecules and a water molecule, which lies on a twofold rotation axis. The side chains of the two molecules have slightly different orientations, the $\text{C}=\text{N}-\text{N}-\text{C}$ torsion angle being -163.03 (15)° in one and -177.52 (14)° in the other, with each adopting a *trans* configuration with respect to the $\text{C}=\text{N}$ bond. In the crystal, molecules are linked into chains extending along b by $\text{N}-\text{H}\cdots\text{O}$, $\text{O}-\text{H}\cdots\text{N}$ and $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds and in addition, four intermolecular $\text{C}-\text{H}\cdots\pi$ interactions are present.

(*E*)-Methyl *N'*-[(1*H*-indol-3-yl)methylidene]hydrazinecarboxylate 0.25-hydrate**Lu-Ping Lv, Tie-Ming Yu, Wen-Bo Yu and Xian-Chao Hu****S1. Comment**

Schiff bases have attracted much attention due to their potential analytical applications (Cimerman *et al.*, 1997). They are also important ligands, which have been reported to have mild bacteriostatic activity and are used as potential oral iron-chelating drugs for genetic disorders such as thalassemia (Offe *et al.*, 1952; Richardson *et al.*, 1988). Metal complexes based on Schiff bases have received considerable attention because they can be utilized as model compounds of active centres in various complexes (Tamboura *et al.*, 2009). We report here the crystal structure of the title compound $C_{11}H_{11}N_3O_2 \cdot 0.25H_2O$.

The title compound (Fig. 1) has two independent, but almost conformationally identical molecules in the asymmetric unit, together with a water molecule of solvation which lies on a twofold rotation axis. Each molecule adopts a *trans* configuration with respect to the C=N bond. The N2/N3/O1/O2/C10/C11 and N5/N6/O3/O4/C21/C22 planes form dihedral angles of 20.39 (6)° and 16.57 (6)°, respectively, with the C1—C8/N1 and C12—C19/N4 planes. The dihedral angle between the two independent benzene rings is 64.06 (4)°. The bond lengths and angles are comparable to those observed for methyl *N'*-[(*E*)-4-methoxybenzylidene]hydrazinecarboxylate (Shang *et al.*, 2007).

The molecules are linked into chains extending along the *b* axis by N—H⋯O, O—H⋯N and O—H⋯O hydrogen bonds (Table 1 and Fig. 2). In addition, four intermolecular C—H⋯ π interactions are present.

S2. Experimental

1*H*-Indole-3-carbaldehyde (1.45 g, 0.01 mol) and methyl hydrazinecarboxylate (0.90g, 0.01 mol) were dissolved in stirred methanol (15 ml) and left for 3.5 h at room temperature. The resulting solid was filtered off and recrystallized from ethanol to give the title compound in 93% yield. Single crystals suitable for X-ray analysis were obtained by slow evaporation of an ethanol solution at room temperature (m.p. 465–467 K).

S3. Refinement

The water H atom was located in a difference Fourier and both positional and isotropic displacement parameters were refined. Other H atoms were positioned geometrically (N—H = 0.86 Å and C—H = 0.93 or 0.96 Å) and refined using a riding model, with $U_{iso}(H) = 1.2U_{eq}(C,N)$ and $1.5U_{eq}(C_{methyl})$. A rotating group model was used for the methyl H atoms.

**Figure 1**

The molecular conformation and atom numbering scheme for the two independent organic molecules and the water molecule of solvation in the asymmetric unit of the title compound. The water molecule lies on a twofold rotation axis and the hydrogen bond is shown as a dashed line. Displacement ellipsoids are drawn at the 30% probability level.

Figure 2

Part of the crystal packing of the title compound in the unit cell. Hydrogen bonds are shown as dashed lines.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F , and R-factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg4 and Cg5 are the centroids of the C16—C19/N4 and C12—C17 rings, respectively.
