Received 3 August 2011; accepted 18 August 2011

 Key indicators: single-crystal X-ray study; $T = 120$ K; mean $\sigma(\text{C}-\text{C}) = 0.004$ Å; R factor = 0.036; wR factor = 0.095; data-to-parameter ratio = 12.5.

The title compound, $\text{C}_{16}\text{H}_{14}\text{Cl}_2\text{N}_4$, is isomorphous with 2,9-dimethyl-6*H*,13*H*-5:12,7:14-dimethanodibenzo[*d,i*]-[1,3,6,8]-tetraazecine [Rivera *et al.* (2009). *Acta Cryst.* **E65**, o2553] and has twofold symmetry, with two carbon atoms located on a twofold axis. Only van der Waals forces occur between molecules in the crystal. In the isomorphous compound the crystal structure is stabilized by weak $\text{C}-\text{H}\cdots\pi$ interactions.

S1. Comment

Macrocyclic oligoaza compounds such as title compound (**I**) have been prepared in a variety of structural modifications and studied widely (Schönherr *et al.*, 2004). With regard to their use in the synthesis of ring-fused amins which are of considerable interest as useful building block and as potential drug candidates (Polshettiwar & Varma, 2008) we have used aromatic macrocyclic amins to perform one-pot synthesis of benzimidazole compounds (Rivera *et al.*, 2008). Engaged in the development of new synthetic pathways of ring-fused amins, we undertaken the synthesis of the macrocyclic amin 2,9-dichloro-6H,13H-5:12,7:14-dimethane- dibenzo[*d,i*][1,3,6,8]tetraazecine (**I**), by the reaction of 4-chloro-1,2-diaminobenzene with aqueous formaldehyde using a water-MeOH mixture as solvent. The title compound, shown in Fig. 1, is isomorphous with 2,9-dimethyl-6H,13H-5:12,7:14-dimethane- dibenzo[*d,i*][1,3,6,8]tetraazecine (Rivera *et al.*, 2009) and has twofold symmetry, with the C1 and C3 atoms located on a twofold axis and is The bond lengths and angles of the title compound are within normal ranges and are comparable with the isomorphous compound and with the related compound 6H,13H-5:12,7:14-dimethanedibenzo[*d,i*][1,3,6,8]tetraazecine (Murray-Rust & Smith, 1975). However, the C6—C7 bond [1.369 (4) Å] in (**I**) is slightly shorter than that observed in the isomorphous structure [1.385 (3) Å Rivera *et al.*, 2009], suggesting some effect of halogen substitution. This fact is further supported by the C7—C8 bond length [1.403 (2) Å], which is slightly longer than C6—C7 bond [1.369 (4) Å]. The crystal packing is stabilized by van der Waal's force. In the isomorphous compound the crystal structure is stabilized by weak C—H \cdots π interactions.

S2. Experimental

A solution of 4-chloro-1,2-diaminobenzene (142 mg, 1 mmol) in MeOH/H₂O (5 ml/15 mL) was added dropwise to an aqueous formaldehyde solution (5 ml, 37%) at 273 K. The mixture was allowed to stir for 1 h. at 273 K during which time a white solid was slowly deposited. After completion of the reaction title compound was obtained by filtration of the reaction mixture. The compound isolated was thoroughly washed with water and dried *in vacuo*. Slow evaporation of an ethyl acetate solution of the title compound yielded crystals suitable for single-crystal X-ray diffraction in 48% yield. Melting point 468 K.

S3. Refinement

All hydrogen atoms were placed in calculated positions with C—H distance 0.96 Å and refined as riding. The isotropic atomic displacement parameters of hydrogen atoms were evaluated as $1.2 \times U_{eq}$ of the parent atom.

**Figure 1**

A view of the title compound with the numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

Special details

Refinement. The refinement was carried out against all reflections. The conventional R -factor is always based on F . The goodness of fit as well as the weighted R -factor are based on F and F^2 for refinement carried out on F and F^2 , respectively. The threshold expression is used only for calculating R -factors *etc.* and it is not relevant to the choice of reflections for refinement.

The program used for refinement, Jana2006, uses the weighting scheme based on the experimental expectations, see `_refine_ls_weighting_details`, that does not force S to be one. Therefore the values of S are usually larger than the ones from the *SHELX* program.
