Received 7 October 2011; accepted 18 October 2011

Key indicators: single-crystal X-ray study; T = 223 K; mean σ(C–C) = 0.005 Å; R factor = 0.040; wR factor = 0.082; data-to-parameter ratio = 15.5.

The title compound, $[Cd(C_{12}H_8N_2)_2(H_2O)_2]SO_4\cdot 6H_2O$, was obtained unexpectedly during an attempt to synthesize a cadmium complex with bidentate bridging sulfate ligands *via* hydrothermal synthesis. The Cd^{II} metal ion is six-coordinated by two chelating 1,10-phenanthroline ligands and two water molecules, resulting in a distorted octahedral geometry for the metal ion. The two chelating N_2C_2 groups are almost perpendicular to each other [dihedral angle = 86.75 (2)°]. In the crystal, the $[Cd(C_{12}H_8N_2)_2(H_2O)_2]^{2+}$ complex cations join with the sulfate anions through two $O_{water}—H\cdots O_{sulfate}$ hydrogen bonds. These ion pairs are further interlinked into a two-dimensional supermolecular structure *via* additional $O—H\cdots O$ hydrogen bonds.

Diaquabis(1,10-phenanthroline-κ^2N,N')cadmium sulfate hexahydrate

Kai-Long Zhong

S1. Comment

Recently we have synthesized and reported many four-membered ring structural characteristics metal-Phen (1,10-phenanthroline) complexes with bidentate-chelating sulfate auxiliary ligand *via* a hydrothermal (solvothermal) reaction, such as cobalt complexes (Zhong *et al.*, 2006; Zhong, 2010), nickel complexes (Zhong *et al.*, 2009; Ni *et al.*, 2010), zinc complex (Cui *et al.*, 2010), and manganese complex (Zhu *et al.*, 2006). The title compound $[Cd(C_{12}H_8N_2)_2(H_2O)_2]SO_4.6H_2O$, (I) was obtained during an attempt to synthesize a four-membered ring structural characteristics Cd-complex with bidentate-chelating sulfate ligand by the similar route. Here we report the crystal structure of (I).

In the cation of (I), all bond lengths and angles are normal (Allen *et al.*, 1987). The Cd^{2+} metal ion has a distorted octahedral coordination environment composed of four N atoms from two chelating Phen ligands and two O atoms from two water molecules. The dihedral angle between the two chelating N_2C_2 groups is 86.75 (2) Å. The Cd—O bond distances [2.256 - 2.288 Å], the Cd—N bond distances [2.327 (2) - 2.377 (2) Å] and the N—Cd—N bite angles [71.32 (8)–71.63 (8)°] (Table 1.) are in good accord with those observed in many six-coordinate Cd-phen complexes $[Cd(phen)_2(H_2O)_2](C_4H_2O_4).4H_2O$ (Yang *et al.*, 2003), $[CdSO_4(C_{12}H_8N_2)_2].C_2H_6O_2$ (Lu *et al.*, 2006) and $[CdSO_4(C_{12}H_8N_2)_2].C_3H_8O_2$ (Zhong & Cui, 2010). The $[Cd(C_{12}H_8N_2)_2(H_2O)_2]^{2+}$ complex cations and uncoordinated sulfate anion are connected by intermolecular O—H···O hydrogen bonds with the coordinated water molecules as donors (Fig. 1. and Table 2.). These units are further held together by typical O—H···O hydrogen bonding with uncoordinated water forming a two-dimensional hydrogen bond network (Fig. 2. and Table 2.).

S2. Experimental

0.2 mmol phen, 0.1 mmol $3CdSO_4.8H_2O$ and 2.0 ml water were mixed and placed in a thick Pyrex tube, which was sealed and heated to 413 K for 72 h, whereupon colorless block-shaped crystals of (I) were obtained.

S3. Refinement

The H atoms of phen were positioned geometrically and allowed to ride on their parent atoms, with C—H = 0.93 Å and $U_{iso}(H) = 1.2U_{eq}(C)$. The H atoms of waters were located in difference map and then allowed to ride on their parent atoms, with O—H = 0.77 (3) - 0.87 (2)Å and $U_{iso}(H) = 1.5U_{eq}(O)$.

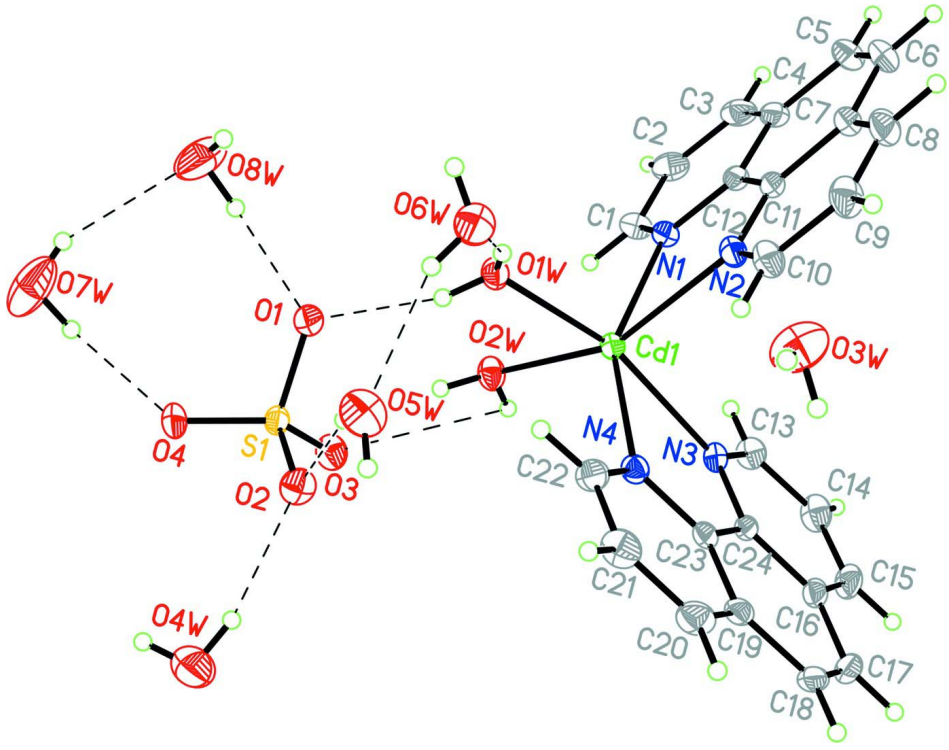

Figure 1

The asymmetric unit of (I), showing the atom-numbering scheme and with displacement ellipsoids drawn at the 30% probability level. The dashed lines represent O—H···O interactions.

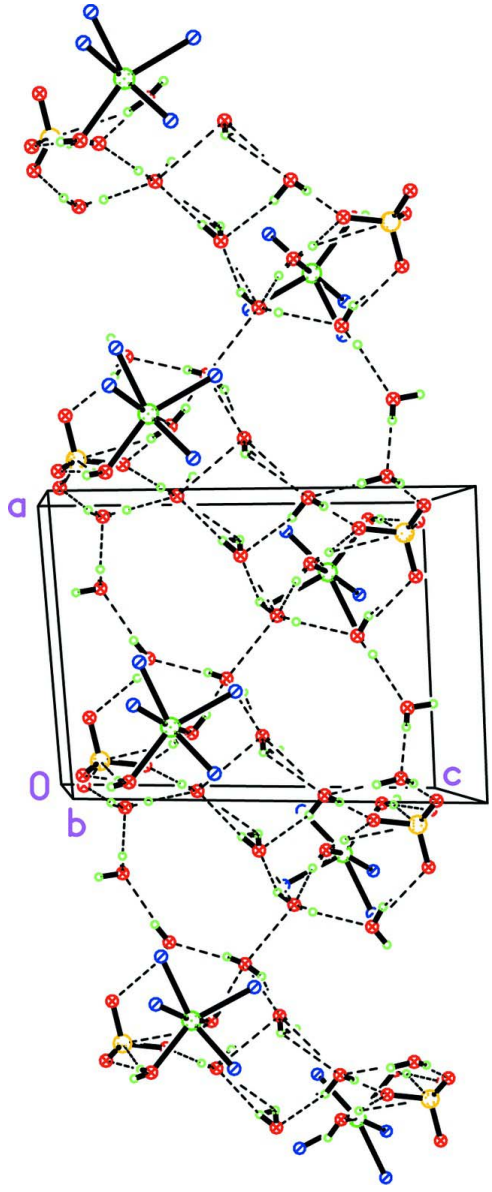

Figure 2

The packing viewed down the *b* axis. Dashed lines indicate hydrogen bonds. All H atoms and C atoms of phen have been omitted for clarity.

Refinement

Refinement on F^2
Least-squares matrix: full
$R[F^2 > 2\sigma(F^2)]$ = 0.040
$wR(F^2)$ = 0.082
S = 1.04
6631 reflections
427 parameters
63 restraints
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w = 1/[\sigma^2(F_o^2) + (0.0339P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$(\Delta/\sigma)_{max}$ = 0.002
$\Delta\rho_{max}$ = 0.56 e Å^{-3}
$\Delta\rho_{min}$ = −0.54 e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
