Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.003 Å; R factor = 0.028; wR factor = 0.065; data-to-parameter ratio = 14.8.

In the title compound, $\{[Sr(C_{12}H_{10}O_{12})(H_2O)]\cdot H_2O\}_n$, the Sr^{II} ion is coordinated by six O atoms of five symmetry-related 3,4,5,6-tetracarboxycyclohexane-1,2-dicarboxylate ligands and one water molecule in a slightly distorted monocapped trigonal–prismatic environment. The ligands bridge the Sr^{II} ions, forming a two-dimensional structure. In the crystal, O—H···O hydrogen bonds further connect the structure into a three-dimensional network. The H atoms of two of the carboxyl groups were refined as half-occupancy.

S1. Comment

The synthesis of coordination polymers *via* multidentate ligands have received considerable attention, owing to their novel structures and special functional properties (Liu *et al.*, 2009; Liang *et al.*, 2011; Kitagawa *et al.*, 2004; Jiang & Xu, 2011). cyclohexane-1,2,3,4,5,6-hexacarboxylate acid is a flexible ligand for constructing new coordination compounds (Canadillas-Delgado *et al.*, 2010). The structure of the title complex formed from the reaction of this acid with Sr^{II} ion is reported herein. Some related structures have already appeared in the literature (Che *et al.*, 2006; Yu *et al.* 2007; Chen *et al.*, 2010).

The asymmetric unit of the title compound is shown in Fig. 1. The Sr^{II} ion atom is seven-coordinated by six oxygen atoms of five carboxylate ligands and one oxygen atom of coordinated water molecules. The Sr—O distances from 2.4614 (19) to 2.7043 (17) Å. The Sr^{II} ions are connected *via* the ligands into a extended two-dimensional layer (Fig. 2). There are hydrogen bonding interactions involving the water molecules and some carboxyl O atoms.

S2. Experimental

Solvothermal reactions were carried out at 363 K for 2 d in a Teflon-lined acid digestion bomb with an internal volume of 23 ml followed by slow cooling at 6 K/h to room temperature. A single-phase product consisting of colorless crystals of was obtained from a mixture of cyclohexane-1,2,3,4,5,6-hexacarboxylate acid ($C_{12}H_{12}O_{12}$, 0.0348 g, 0.1 mmol), $Sr(NO_3)_2$ (0.0635 g, 0.3 mmol), and ethanol (5.0 ml) and H_2O (1.0 ml).

S3. Refinement

H atoms were constrained to ideal geometries, with C—H = 0.98 Å, O—H = 0.82–0.85 Å and U_{iso}(H) = 1.2U_{eq}(C);U_{iso}(H) = 1.5U_{eq}(O). The the H atoms of the carboxylic acid groups groups containing O4 and O9 were refined as half occupancy. This is determined by the inversion symmetry realtionship which which cause unrealistic short H···H distances for full occupancy H atoms. The carboxylic acid H atom positions were included on the basis of sensible hydrogen bonds, the longer C-O distance in the group and the non-coordination to Sr.

$\Delta\rho_{min} = -0.55$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
