Received 12 November 2011; accepted 8 December 2011

Key indicators: single-crystal X-ray study; *T* = 298 K; mean $\sigma(C-C)$ = 0.006 Å; disorder in main residue; *R* factor = 0.046; *wR* factor = 0.104; data-to-parameter ratio = 6.6.

In the title compound, C₂₅H₂₆N₄O₃, the two fused pyrrolo[3,2-*d*]pyrimidine rings form a dihedral angle of 3.7 (2) $^\circ$. The two substituent phenyl rings are twisted with respect to the pyrrole and pyrimidine rings, making dihedral angles of 57.2 (2) and 69.0 (2) $^\circ$, respectively. The ethyl and ethoxy groups are disordered over two positions; the site occupancies are 0.53 (1) and 0.47 (1) for ethyl, and 0.63 (1) and 0.37 (1) for ethoxy. The crystal packing features C—H···O hydrogen bonds.

Ethyl 2-diethylamino-4-oxo-3,5-diphenyl-4,5-dihydro-3H-pyrrolo[3,2-*d*]pyrimidine-7-carboxylate

Hai-Tao Gao, Li Li, Fang Ye and Yang-Gen Hu

S1. Comment

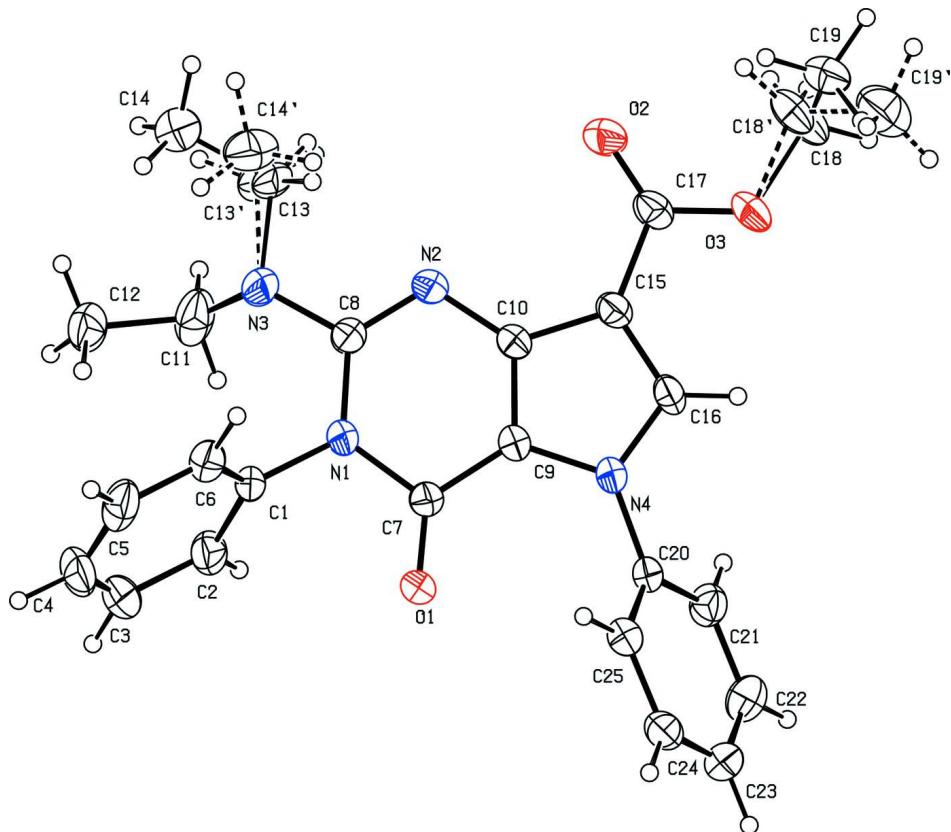

As a part of our ongoing work in the preparation of derivatives of heterocyclic compounds (Hu *et al.*, 2006, 2007, 2010; He *et al.*, 2007a,b; Ma *et al.* 2009; Zeng *et al.*, 2008), we have synthesized and structurally characterized the title compound (Fig. 1). In the molecule, the two fused rings of pyrrolo[3,2-*d*]pyrimidine form a dihedral angle of 3.7 (2)°. The attached two phenyl rings are twisted with respect to the heterocyclic pyrrolo[3,2-*d*]pyrimidine system, making dihedral angles of 56.8 (2)° and 69.3 (2)°, respectively. The ethyl group (C13—C14) is disordered over two sites with occupancies that refined to 0.53 (1) and 0.47 (1); the ethoxy group (C18—C19) is also disordered over two sites with occupancies 0.63 (1) and 0.37 (1). The crystal packing is stabilized by intermolecular C—H···O hydrogen bonds. There are no π – π interactions.

S2. Experimental

The title compound was obtained in good yield *via* aza-Wittig reaction. Crystals suitable for single-crystal X-ray diffraction were obtained by recrystallization from a mixture of ethanol and dichloromethane (1:1 *v/v*) at room temperature.

S3. Refinement

All H atoms were located in difference maps and treated as riding atoms with C—H = 0.93 Å, $U_{\text{iso}}=1.2U_{\text{eq}}$ (C) for Csp^2 , C—H = 0.97 Å, $U_{\text{iso}} = 1.2U_{\text{eq}}$ (C) for CH_2 , C—H = 0.96 Å, $U_{\text{iso}} = 1.5U_{\text{eq}}$ (C) for CH_3 , N—H = 0.86 Å, $U_{\text{iso}} = 1.2U_{\text{eq}}$ (N) for NH.

Refinement

Refinement on F^2
 Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.046$
 $wR(F^2) = 0.104$
 $S = 1.00$
 2192 reflections
 332 parameters
 12 restraints
 Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map
 Hydrogen site location: inferred from neighbouring sites
 H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + (0.063P)^2]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.15 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.19 \text{ e } \text{\AA}^{-3}$
 Absolute structure: no

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
