

## Bis(diisopropylammonium) tetrachlorido-cuprate(II)

Jie Xu

College of Chemistry and Chemical Engineering, Southeast University, Nanjing 210096, People's Republic of China  
Correspondence e-mail: wangyc33@yahoo.com.cn

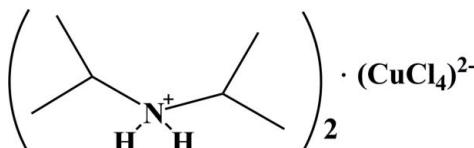

Received 3 February 2012; accepted 4 February 2012

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.035;  $wR$  factor = 0.081; data-to-parameter ratio = 25.8.

In the title molecular salt,  $(\text{C}_6\text{H}_{16}\text{N})_2[\text{CuCl}_4]$ , the  $\text{Cu}^{\text{II}}$  ion adopts an extremely distorted tetrahedral coordination geometry. All the ammonium H atoms are involved in  $\text{N}-\text{H}\cdots\text{Cl}$  hydrogen bonds, which serve to link the cations and anions into chains propagating along the  $c$ -axis direction.

### Related literature

## Bis(diisopropylammonium) tetrachloridocuprate(II)

**Jie Xu**

### S1. Comment

Simple organic salts containing amino cations have attracted an attention as materials which display ferroelectric-paraelectric phase transitions (e.g. Fu *et al.*, 2011). As part of our ongoing studies in this area, we now present the crystal structure of the title compound.

The asymmetric unit of the title compound contains two di-isopropylammonium cations and one  $\text{CuCl}_4^{2-}$  anion (Table 1 and Fig. 1). Both the amine N atoms are protonated.

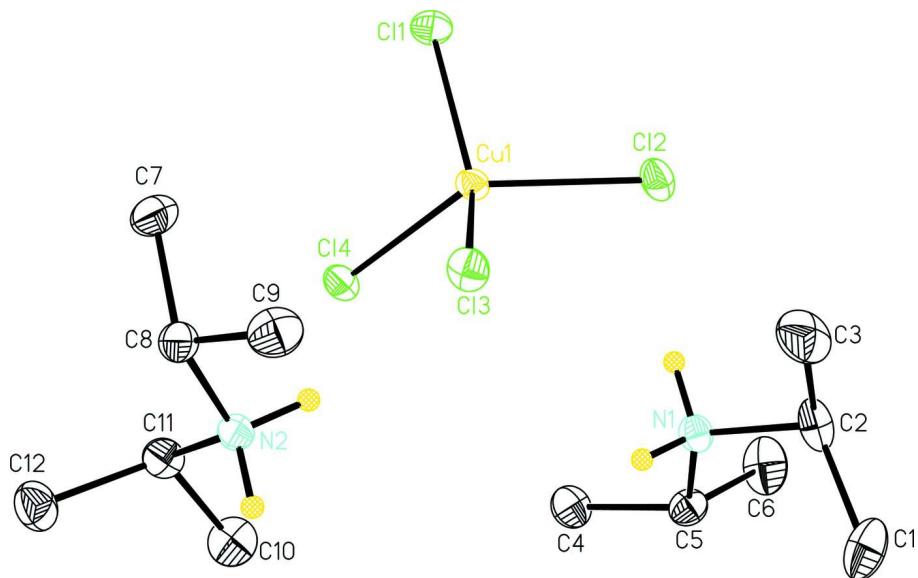

In the crystal structure, all the amino H atoms are involved in N—H $\cdots$ Cl H-bonding interactions with the Cl atoms of the  $\text{CuCl}_4^{2-}$  anion with N $\cdots$ Cl distances between the range of 3.243 (2) $\text{\AA}$  to 3.321 (2) $\text{\AA}$ . These hydrogen bonds link the ionic units into a one-dimensional chain along the *c*-axis (Table 2 and Fig. 2).

### S2. Experimental

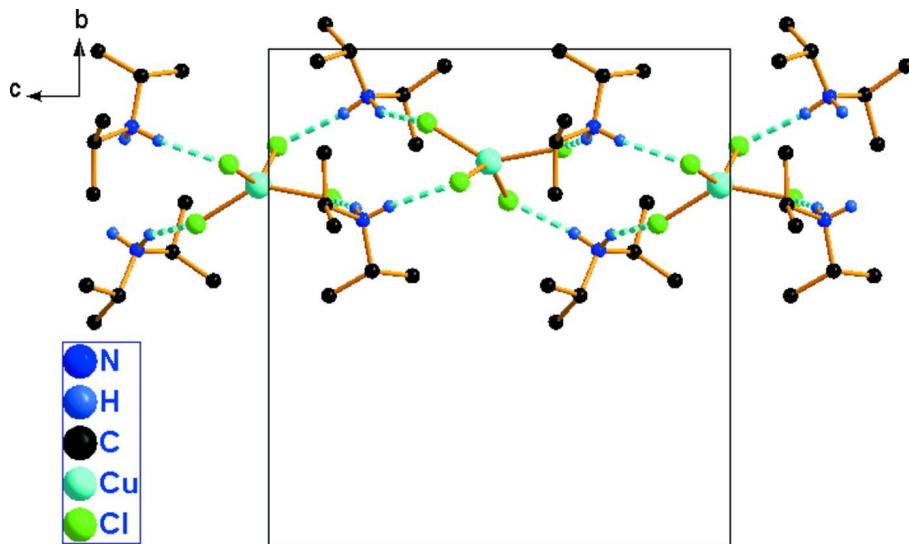

A mixture of di-isopropylamine (0.8 mmol) and  $\text{CuCl}_2$  (0.4 mmol) were dissolved in HCl/EtOH/distilled water (1:1:1 *v/v*) solvent. The solution was slowly evaporated in air affording blue block-shaped crystals of the title compound.

### S3. Refinement

The H atoms were geometrically placed ( $\text{C—H} = 0.96\text{--}0.98\text{\AA}$ ,  $\text{N—H} = 0.90\text{\AA}$ ) and refined as riding with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$ (carrier) or  $1.5U_{\text{eq}}$ (C methyl).

**Figure 1**

A view of the title compound with displacement ellipsoids drawn at the 30% probability level. C-bound H atoms have been omitted for clarity.

**Figure 2**

The crystal packing of the title compound viewed along the  $a$  axis showing the one-dimensionnal hydrogen bondings chain (dashed line). H atoms not involved in hydrogen bonding (dashed line) have been omitted for clarity.

H-atom parameters constrained  
 $w = 1/[\sigma^2(F_o^2) + (0.029P)^2 + 0.869P]$   
where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} = 0.001$   
 $\Delta\rho_{\max} = 0.50 \text{ e \AA}^{-3}$   
 $\Delta\rho_{\min} = -0.41 \text{ e \AA}^{-3}$

#### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor  $wR$  and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
