Received 9 March 2012; accepted 15 March 2012

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.003 Å; disorder in main residue; R factor = 0.031; wR factor = 0.078; data-to-parameter ratio = 12.8.

In the title compound, $[Co(C_5HF_6O_2)_2(C_9H_8N_2)]$, the Co^{II} centre exhibits a pseudooctahedral coordination geometry, comprising two N-atom donors from the bidentate aminoquinoline ligand and four O-atom donor atoms from two bidentate chelating 1,1,1,5,5,5-hexafluoropentane-2,4-dionate ligands. In the crystal, molecules are linked *via* pairs of N—H···O hydrogen bonds, forming inversion dimers. These dimers are further connected through π–π interactions between neighbouring quinoline rings [centroid–centroid distance = 3.472 (2) Å], and stack along the c axis.

David J. Harding, Darunee Sertphon and Phimphaka Harding

S1. Comment

Metal *β*-diketonates can serve as excellent building blocks in the formation of supramolecular networks. For instance, the use of hydrogen-bonding ligands allows isolation of linear chains (Aakeröy *et al.*, 2004,2005). In this paper we report the synthesis and structure of [Co(hfac)$_2$(NH$_2$-quin)] (hfac = 1,1,1,5,5,5-hexafluoropentane-2,4-dionato; NH$_2$-quin = 8-aminoquinoline).

The reaction of [Co(hfac)$_2$(H$_2$O)$_2$] with 8-aminoquinoline in THF yields [Co(hfac)$_2$(NH$_2$-quin)] **1** which crystallizes from CH$_2$Cl$_2$/hexanes in the space group $P\overline{1}$ (Figure 1). The cobalt metal centre is six-coordinate with a distorted octahedral geometry, the hfac ligands adopting a *cis* arrangement enforced by the chelating NH$_2$-quin ligand. The compound is isostructural with [Ni(hfac)$_2$(NH$_2$-quin)] (Sertphon *et al.*, 2011). The Co—N and Co—O bond lengths (Table 1) are comparable with those reported in *trans*-[*M*(hfac)$_2$(py-CH=CH—C$_6$F$_4$Br)$_2$] (Aakeröy *et al.*, 2007) and [Co(hfac)$_2$(ppa^{Br})] {ppa^{Br} = 4-bromophenyl(2-pyridylmethylidene)amine, Harding *et al.*, 2010}. The *β*-diketonate ligands exhibit a *planar* coordination mode in which the angles between the planes defined by the Co and oxygen atoms and the carbon and oxygen atoms of the *β*-diketonate ligand are 1.7° and 7.6°. Similarly, in *trans*-[*M*(hfac)$_2$(py-CH=CH—C$_6$F$_4$Br)$_2$] (*M* = Co, Cu) the *β*-diketonate ligands are also *planar* (Aakeröy *et al.*, 2007).

The packing in the structure involves two sets of N–H···O interactions between the amino protons of the NH$_2$-quin ligand and the coordinated O atoms of the *β*-diketonate forming discrete dimers {N2—H2A···O2 = 2.135 (2) Å, N2—H2B···O2 2.557 (2) Å, Figure 2 & Table 2}. Similar interactions are also found in [Ni(dbm)$_2$(dmae)] (dmae = dimethylaminoethylamine) and appear to be a feature of these types of compounds (Harding *et al.*, 2009). In addition, there is a *π*-*π* interaction between the quinolyl rings of neighbouring NH$_2$-quin ligands as shown in Figure 3 {*Cg*1—*Cg*1^{i} = 3.472 (2) Å where *Cg*1 is the centroid of the ring C11—C15,N1; i = symmetry code = -*x*, 1 - *y*, 2 - *z*}. The hydrogen bonds mentioned above combine with the *π*-*π* interactions to form one-dimensional chains.

S2. Experimental

To a deep orange red solution of [Co(hfac)$_2$(H$_2$O)$_2$] (1.0300 g, 2 mmol) in THF (10 ml) was added 8-aminoquinoline (0.2884 g, 2 mmol) giving a red-brown solution which was stirred for 2 hr. After evaporating to low volume (*ca*. 2 ml), hexane (3 ml) was added giving an orange precipitate which was filtered and washed with hexanes (2×4 ml) and air dried giving orange microcrystals, 0.8794 g (71%). X-ray quality crystals were grown by layering a CH$_2$Cl$_2$ solution with hexane (10 ml) leading to orange crystals after 2 days. IR in KBr disc $\nu_{C=O}$ 1642 cm^{-1}. UV-Vis (in CH$_2$Cl$_2$, ε mol.dm^{-3}cm^{-1}) 406sh (340), 416sh (300), 505 (120). C$_{19}$H$_{10}$Co F$_{12}$N$_2$O$_4$; calc. C 37.0, H 1.6, N 4.5; found C 36.8, H 1.5, N 4.3.

S3. Refinement

Hydrogen atoms were placed geometrically and refined with a riding model and with U_{iso} constrained to be 1.2 (aromatic CH) or 1.5 (NH_2) × U_{eq} of the carrier atom.

Two of the CF_3 groups in one of the hfac ligands were found to be disordered and were modeled by refining the fluorine atoms in two positions. SIMU and DELU restrainsts were applied resulting in an occupancy of 70/30 (2) for F1A—F3B and 57/43 (3) for F4A—F6B.

$\Delta\rho_{min} = -0.55$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
