In the title complex, $[Mn(N_3)_2(C_8H_8N_6)_2]$, the complete molecule is generated by the application of twofold symmetry, and is in a distorted octahedral environment, coordinated by four N atoms of two bidentate 6-(pyridin-2-yl)-1,3,5-triazine-2,4-diamine ligands and two N atoms from two azide anions. The two chelated 6-(pyridin-2-yl)-1,3,5-triazine-2,4-diamine ligands form a dihedral angle 74.75 (5)°. The mononuclear molecules are alternatively linked into layers parallel to the *ac* plane *via* N—H⋯N hydrogen bonds. Adjacent layers are connected into a three-dimensional supramolecular framework by futher N—H⋯N hydrogen-bonding interactions.

S1. Comment

Pyridyl-substituted diaminotriazine compounds are widely used as ligands in supramolecular chemistry because of their marked ability to associate by forming hydrogen bonds, aromatic interactions, and coordination to metals (Duong *et al.*, 2011). The pseudohalide azides have also been widely used due to their versatile bridging modes. A large number of azide compounds have been synthesized based on two azide coordination modes: 1) the end-on (EO) and 2) the end-to end (EE) (He *et al.*, 2004; Carranza *et al.*, 2008). Herein this article, we report the crystal structure of the title compound, a mononuclear Mn^{II} complex. An isomorphous Zn-complex has been reported (Zhao *et al.*, 2009).

The structure of the title compound (Fig. 1) comprises a mononuclear Mn^{II} complex wherein Mn^{II} lies on an inversion center. The Mn^{II} atom is coordinated by two terminal EO azide anions and two 6-(pyridin-2-yl)-1,3,5-triazine ligands *via* pyridyl and triazine N atoms forming a pseudo-octahedral geometry with Mn—N distances in the range 2.192 (2) to 2.277 (2) Å. The EO azide anions are in a terminal non-linear coordination mode with the Mn^{II} center as is apparent from the Mn1—N7—N8 bond angle of 116.82 (9) °. The 6-(pyridin-2-yl)-1,3,5-triazine ligands are nearly planar, with the largest deviation of any atom from its mean-plane being -0.116 Å for C3. The two chelated diaminotriazine ligands are twisted with respect to each other by a dihedral angle of 74.75 (5) °. The adjacent complex molecules are linked through intermolecular hydrogen bonds N6—H6A⋯N3 and N6—H6B⋯N7 between azide groups and diaminotriazine groups (Table 1) forming an infinite hydrogen bonded layer running parallel to the *ac* plane. In addition, hydrogen bonding interactions N5—H5A⋯N9 connect the neighboring layers to a three-dimensional supramolecular framework (Fig. 2).

S2. Experimental

A mixture of Mn(CH$_3$COO)$_2$.2H$_2$O (0.1 mmol, 0.025 g), 6-(pyridin-2-yl)-1,3,5-diaminotriazine (0.2 mmol, 0.035 g) in methanol (20.0 ml) was stirred for 40 min and the mixture was filtered, sealed and kept in a dark place at room temperature for several weeks. Block crystals suitable for X-ray diffraction analysis were produced in 10% yield.

S3. Refinement

The H atoms of pyridine ring and amino groups were generated geometrically and included in the refinement in the riding model approximation with C—H = 0.93 and N—H = 0.86 Å and $U_{iso}(H) = 1.2U_{eq}(C/N)$.
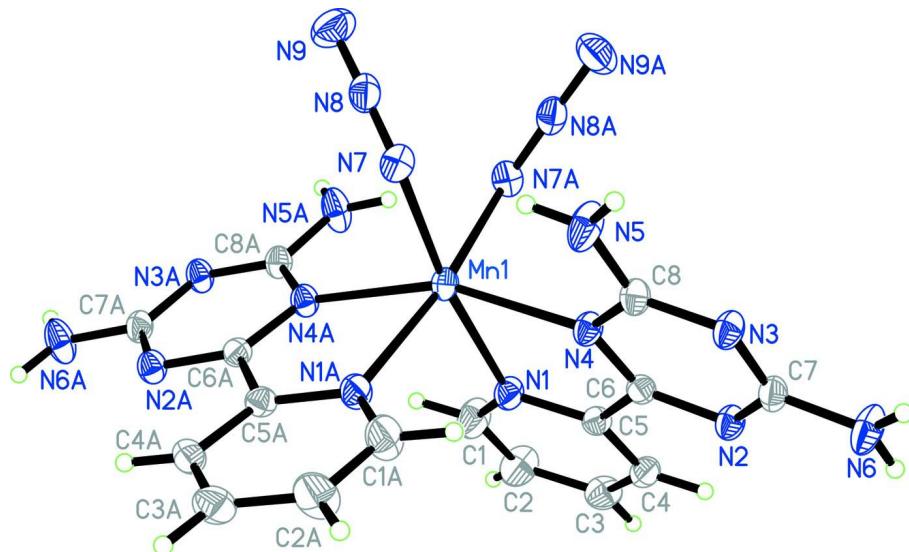

Figure 1

The molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are presented as small spheres of arbitrary radius. [symmetry code: A -x + 1, y, z - 1/2]
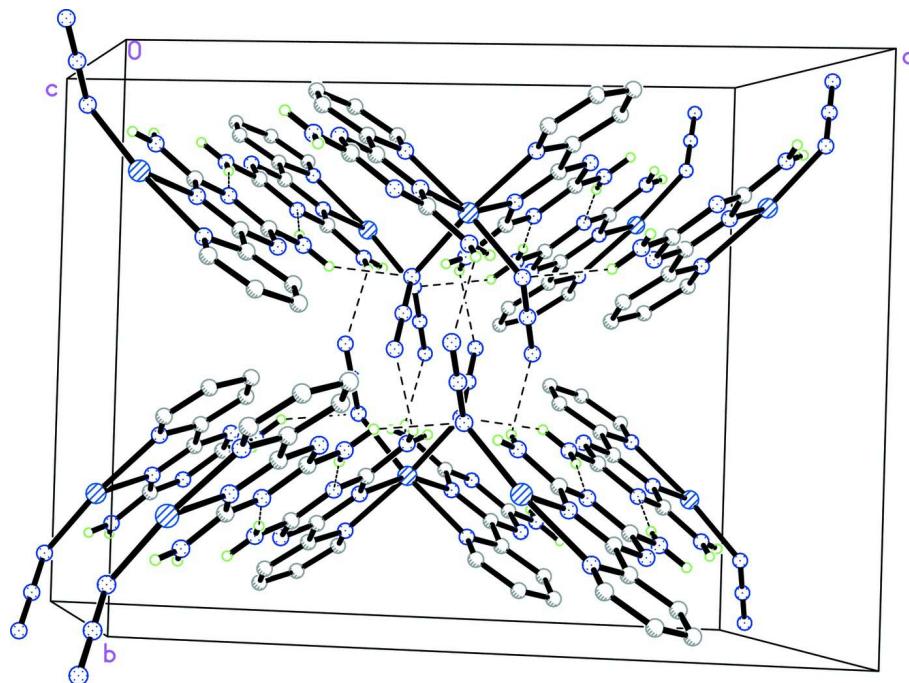

Figure 2

A view of the N—H⋯N hydrogen bonds (dotted lines) in the crystal structure of the title compound. H atoms non-participating in hydrogen- bonding were omitted for clarity.

Data collection

Bruker APEXII 1K CCD area-detector diffractometer	7095 measured reflections
	2600 independent reflections
Radiation source: fine-focus sealed tube	1562 reflections with $I > 2\sigma(I)$
Graphite monochromator	$R_{int} = 0.056$
phi and ω scans	$\theta_{max} = 28.4°$, $\theta_{min} = 1.9°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 2004)	$h = -21 \rightarrow 24$
	$k = -19 \rightarrow 17$
$T_{min} = 0.924$, $T_{max} = 0.947$	$l = -11 \rightarrow 11$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	
$R[F^2 > 2\sigma(F^2)] = 0.046$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.106$	
$S = 1.01$	H-atom parameters constrained
2600 reflections	$w = 1/[\sigma^2(F_o^2) + (0.0378P)^2]$
159 parameters	where $P = (F_o^2 + 2F_c^2)/3$
0 restraints	$(\Delta/\sigma)_{max} < 0.001$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{max} = 0.33$ e Å^{-3}
	$\Delta\rho_{min} = -0.38$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
