## 2,2'-Dichloro-*N,N'*-[1,3-phenylenebis-(methylen)]diacetamide

Hong-Xin Cai and Wei-Na Wu\*

Department of Physics and Chemistry, Henan Polytechnic University, Jiaozuo 454000, People's Republic of China

Correspondence e-mail: wuwn08@hpu.edu.cn

Received 24 February 2012; accepted 27 February 2012

 Key indicators: single-crystal X-ray study;  $T = 296$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å;  $R$  factor = 0.055;  $wR$  factor = 0.157; data-to-parameter ratio = 19.0.

The complete molecule of the title compound,  $\text{C}_{12}\text{H}_{14}\text{Cl}_2\text{N}_2\text{O}_2$ , is generated by a crystallographic twofold axis with two C atoms of the central benzene ring lying on the axis. In the crystal,  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds link the molecules into chains parallel to the  $c$  axis.

**2,2'-Dichloro-*N,N'*-[1,3-phenylenebis(methylene)]diacetamide****Hong-Xin Cai and Wei-Na Wu****S1. Comment**

The luminescent properties of the lanthanide complexes with amide type ligands have been investigated in our previous work (Wu *et al.*, 2008). As part of our ongoing studies of the amide type ligands, the title compound was synthesized and characterized by X-ray diffraction.

The complete molecule of the title compound (Fig. 1) is generated by a crystallographic twofold axis with atoms C5 and C7 of the central phenyl group lying on the axis. All the bond lengths are comparable with those observed in a similar compound (Yuan *et al.*, 2010). In the crystal, intermolecular N—H $\cdots$ O hydrogen bonds link the molecules into chains parallel to the *c* axis (Table 1).

**S2. Experimental**

A chloroform solution containing chloroacetyl chloride (2.26 g, 0.02 mol) was added dropwise to a solution of (3-(aminomethyl)phenyl)methanamine (1.36 g, 0.01 mol) and pyridine (1.60 g, 0.02 mol) in chloroform (20 ml) under stirring on a ice-water bath. Then, the reaction mixture was stirred at room temperature for 3.5 h. A solid product was separated from the solution by suction filtration, purified by washing with water, 0.5 mol/L HCl, 0.5 mol/L NaOH and distilled water, respectively. Colourless prism crystals were obtained by slow evaporation of the acetone solution at room temperature.

**S3. Refinement**

The H atoms were placed at calculated positions and refined in riding mode, with the carrier atom-H distances = 0.93 Å for aryl, 0.97 Å for methylene and 0.86 Å for the secondary amine H atoms. The  $U_{\text{iso}}$  values were constrained to be  $1.2U_{\text{eq}}$  of the carrier atom for the H atoms.

Figure 1

The molecular structure shown with 50% probability displacement ellipsoids. Unlabelled atoms are related with the labelled ones by symmetry operation  $(-x, y, -z - 1/2)$ .

$\Delta\rho_{\min} = -0.31 \text{ e } \text{Å}^{-3}$

Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
