In the title molecular salt, $(C_{10}H_{24}N)_2[Hg_2Br_6]$, the complete anion is generated by crystallographic inversion symmetry, forming a pair of edge-sharing $HgBr_4$ tetrahedra. In the crystal, the cations and anions are linked by weak C—H···Br interactions.

Related literature

For a related structure and background to molecular ferro-electrics, see: Jin (2012).

supporting information

Bis(butyltriethylammonium) di-*µ*-bromido-bis[dibromidomercurate(II)]

Lei Jin

S1. Comment

Asa part of our studies (Jin, 2012) of molecular salts with possible ferroelectric properties, the title compound has been synthesized and its crystal structure is herein reported.

The title compound, $(C_{10}H_{16}N^+)_2 \cdot Hg_2Br_6^{2-}$ crystallizes in the triclinic P-1 space group, and the structure of title compound contains isolated bitetrahedral $[Hg_2Br_6]^{2-}$ units, which consisiting of two distorted tetrahedral sharing one common edge and two butyltriethylammonium cations (Fig 1). The terminal bond distance of Hg–Br being 2.4963 (18)Å and 2.5059 (17)Å, the bond angles of Br–Hg–Br being in the range from 107.16 (6)° to 122.48 (7)°; the bridging are in the range 2.681 (2)Å and 2.7092 (19)Å, and the bond angles of Br–Hg–Br varying from 107.16 (6)° to 113.07 (7)°, thus deviating from ideal tetrahedral angles of 109.5°. An inversion centre is located an the centre of the $[Hg_2Br_6]^{2-}$ unit,and the bridge distance of Br–Br is 3.860Å.

In the crystal, there are weak C—H···Br hydrogen bonds (Table 1), which link the cations and anions into a three-dimensional network.

S2. Experimental

In room temperature butyltriethylammonium (5 mmol,1.17 g) in 20 ml water, then a water solution with $HgBr_2$ (5 mmol, 1.36 g) was dropped slowly into the previous solution with properly sirring. Colourless blocks were obtained by the slow evaporation of the above solution after one week in air with some colorless solid blocks appeared after days.

The dielectric constant of the compound as a function of temperature indicates that the permittivity is basically temperature-independent ($\varepsilon = C/(T–T_0)$), indicating that this compound is not ferroelectric over the measured temperature range (below the melting point).

S3. Refinement

H atoms were placed in calculated positions(C—H = 0.96Å and 0.97 Å for Csp^3 atoms), assigned fixed U_{iso} values [U_{iso} = 1.2Ueq(Csp^2/N) and 1.5Ueq(Csp^3)] and allowed to ride.
Figure 1

The mlecular structure of the title compound, showing 30% probability displacement ellipsoids. Unlabelled atoms are related to the labelled atoms by the (-x, -y + 2, -z + 1) symmetry transformation.

Butyltriethylammonium di-*µ*-bromido-bis[dibromidomercurate(II)]

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.056$	$w = 1/[\sigma^2(F_o^2) + (0.0572P)^2 + 12.6923P]$
$wR(F^2) = 0.151$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.05$	$(\Delta/\sigma)_{max} < 0.001$
3209 reflections	$\Delta\rho_{max} = 1.27$ e Å^{-3}
141 parameters	$\Delta\rho_{min} = -1.83$ e Å^{-3}
0 restraints	Extinction correction: *SHELXL97* (Sheldrick, 2008), Fc*=kFc[1+0.001xFc$^2\lambda^3$/sin(2θ)]$^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0069 (8)
Secondary atom site location: difference Fourier map	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
