Received 11 April 2012; accepted 20 April 2012

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å;
R factor = 0.028; wR factor = 0.082; data-to-parameter ratio = 9.9.

The title molecule, $\text{C}_5\text{H}_4\text{ClN}_3\text{O}_2$, possesses mirror symmetry, with all of the atoms lying in the mirror plane. There is an intramolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen bond involving the adjacent $-\text{NO}_2$ and $-\text{NH}_2$ groups. A short $\text{C}-\text{H}\cdots\text{O}$ interaction is also observed. In the crystal, adjacent molecules are linked *via* $\text{N}-\text{H}\cdots\text{Cl}$ and $\text{N}-\text{H}\cdots\text{N}$ hydrogen bonds, forming chains propagating along $[100]$.

Related literature

For details concerning the importance of the title compound as an intermediate in organic synthesis, and for the synthetic procedure, see: Hu *et al.* (2011). For bond-length data, see: Allen *et al.* (1987).

2-Chloro-5-nitropyridin-4-amine

Jian-Ling He

S1. Comment

The title compound is an important nitropyridine compound which is widely used in organic synthesis, especially in the synthesis of heterocyclic drugs and cytokine inhibitors (Hu *et al.*, 2011).

The molecular structure of the title compound is shown in Fig. 1. The molecule lies in a mirror plane. In the molecule there is an N-H \cdots O hydrogen bond involving the adjacent NO₂ and NH₂ groups (Table 1). A short C-H \cdots O interaction is also observed. The bond lengths (Allen *et al.*, 1987) and angles are within normal ranges.

In the crystal, adjacent molecules are linked via N-H \cdots Cl and N-H \cdots N hydrogen bonds so forming chains propagating along the a axis direction. (Table 1 and Fig. 2).

S2. Experimental

The title compound was prepared by the literature procedure (Hu *et al.*, 2011). To a solution of *tert*-butyl 2-chloro-5-nitropyridin-4-ylcarbamate (5 g, 18.3 mmol) in dichloromethane (30 ml) in a 100 mL flask was added slowly a solution of trifluoroacetic acid (10 ml). After being stirred for 4 h at the room temperature, the solvent was evaporated on a rotary evaporator. The pH of the remaining mixture was then adjusted to 7 with saturated sodium bicarbonate solution, giving the title compound. Colourless block-like crystals were grown in ethanol (30 ml) by evaporating the solvent slowly at room temperature for about 8 d.

S3. Refinement

The NH H atoms were located in a difference Fourier map and were treated as riding atoms. The C-bound H-atoms were included in calculated positions and treated as riding atoms: C-H = 0.93 Å. For all H atoms $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N,C})$.

Figure 1

The molecular structure of the title molecule, with the atom-numbering. Displacement ellipsoids are drawn at the 50% probability level.

**Figure 2**

A view along the *b* axis of the crystal packing of the title compound. The hydrogen bonds are shown as dashed lines [H atoms not involved in hydrogen bonding have been omitted for clarity].

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
