Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(\text{C}-\text{C}) = 0.006$  Å;  $R$  factor = 0.042;  $wR$  factor = 0.096; data-to-parameter ratio = 15.5.

In the title molecule,  $\text{C}_8\text{H}_7\text{BrO}_2$ , the carboxyl group is twisted by  $76.2(3)^\circ$  from the benzene ring plane. In the crystal, molecules are linked into inversion dimers through pairs of  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds. The dimers are further linked into layers parallel to the  $bc$  plane by weak  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds.

## 2-(2-Bromophenyl)acetic acid

Rajni Kant, Kamini Kapoor and B. Narayana

### S1. Comment

The title compound, (I), has many applications in various syntheses, for example, in the synthesis of heterocyclic compounds (Deshpande *et al.*, 2008) and in the synthesis of AMPA antagonists - substituted quinoxalinediones, quinolones, isatinoximes and benzodiazepine derivatives (Pratt *et al.*, 2000). It can also be used in a gas chromatography as a phase transfer catalyst (Rodriguesa *et al.*, 2002). Herein we report its crystal structure.

In (I) (Fig. 1), all bond lengths and angles are normal and correspond to those observed in related structures (Hodgson & Asplund, 1991; Harris *et al.*, 1994; Hartung *et al.*, 2004; Yuan *et al.*, 2008; Jasinski *et al.*, 2010; Li *et al.*, 2010). The carboxyl group is twisted at 76.2 (3)° from the benzene ring plane. Intermolecular O—H···O hydrogen bonds (Table 1) link the molecules into centrosymmetric dimers. Weak intermolecular C—H···O interactions (Table 1) link further these dimers into layers parallel to *bc* plane.

### S2. Experimental

The title compound was purchased from the Spectrochem Ltd., Mumbai. Single-crystals were grown from acetone and toluene(1:1) mixture by slow evaporation method.

### S3. Refinement

Atom H8 was found in a difference map and isotropically refined. C-bound H atoms were positioned geometrically (C—H 0.93–0.97 Å), and were treated as riding, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

**Figure 1**

### Special details

**Experimental.** *CrysAlis PRO*, Oxford Diffraction Ltd., Version 1.171.34.40 (release 27-08-2010 CrysAlis171. NET) (compiled Aug 27 2010, 11:50:40) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
