Received 18 June 2012; accepted 18 June 2012

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(C-C) = 0.003$ Å; R factor = 0.031; wR factor = 0.071; data-to-parameter ratio = 18.3.

The Zn^{II} atom in the title compound, $[Zn(C_6H_{12}NOS_2)Cl(C_{10}H_8N_2)]$, is coordinated by a chelating *N*-2-hydroxyethyl-*N*-isopropylidithiocarbamate ligand, a 2,2'-bipyridine ligand and a Cl atom. The resulting ClN_2S_2 donor set defines a distorted square-pyramidal coordination geometry. Helical supramolecular chains sustained by $O-H \cdots S$ hydrogen bonds and propagating along the b axis feature in the crystal packing. A three-dimensional architecture is stabilized by $C-H \cdots O$, $C-H \cdots S$ and $C-H \cdots Cl$ interactions.

(Bipyridine- κ^2N,N')chlorido[*N*-(2-hydroxyethyl)-*N*-isopropylthiocarbamato- κ^2S,S']zinc(II)

Fatin Allia Mohamad, Ibrahim Baba, Mohamed Ibrahim Mohamed Tahir and Edward R. T. Tiekink

S1. Comment

Introducing hydroxyethyl functionality into dithiocarbamate ligands facilitates the formation of higher dimensionality in their crystal structures (Benson *et al.*, 2007; Poplaukhin & Tiekink, 2010). As a continuation of these studies, herein, the title compound, Zn[S₂CN(CH₂CH₂OH)*i*Pr](2,2'-bipyridine)Cl, (I), is described.

The molecular structure of (I), Fig. 1, features a Zn^{II} atom coordinated by a dithiocarbamate ligand, two N atoms of the 2,2'-bipyridine ligand and a chloride. The dithiocarbamate ligand coordinates essentially in a bidentate mode, an assignment supported by the near equivalence of the C—S bond distances, Table 1. The resulting ClN₂S₂ donor set defines a coordination geometry intermediate between square pyramidal and trigonal bipyramidal geometry. This is quantified by the value of $\tau = 0.23$ which compares to the τ values of 0.0 and 1.0 for ideal square pyramidal and trigonal bipyramidal geometries, respectively (Addison *et al.*, 1984).

The crystal packing of (I) features helical supramolecular chains along the *b* axis that are sustained by O—H \cdots S interactions, Fig. 2 and Table 2. Additional stability to the chains are afforded by C—H \cdots O and C—H \cdots S interactions, Table 2. The chains are connected into a three-dimensional architecture by C—H \cdots Cl interactions, Fig. 3 and Table 1.

S2. Experimental

This compound was prepared using the *in situ* method by the addition of carbon disulfide (0.01 mol) to an ethanolic solution of isopropylethanolamine (0.01 mol). The mixture was stirred for one hour at 277 K. Then, it was added dropwise to a solution of zinc dichloride (0.005 mol) in ethanol (20 ml) followed by 2,2'-bipyridine (0.01 mol) in ethanol (20 ml). The mixture was stirred for another two hours at 277 K. The white precipitate was filtered, washed with cold ethanol and dried in a desiccator. Crystallization was from its ethanol:chloroform (1:2) solution held at room temperature. Yield: 65.5%. *M.pt.* 424–426 K. Elemental analysis. Found (calculated) for C₁₆H₂₀ClN₃OS₂Zn: C, 45.21 (44.70); H 3.59 (3.50); N 9.69 (9.70); S 15.12 (14.90)%. IR (KBr): $\nu(\text{O—H})$ 3391 m; $\nu(\text{C}\equiv\text{N})$ 1442 s; $\nu(\text{C}\equiv\text{S})$ 944 s; $\nu(\text{Zn—S})$ 368 m cm⁻¹.

S3. Refinement

Carbon-bound H-atoms were placed in calculated positions (C—H 0.95 to 0.99 Å) and were included in the refinement in the riding model approximation, with $U_{\text{iso}}(\text{H}) = 1.2$ to $1.5U_{\text{equiv}}(\text{C})$. The oxygen-bound H-atom was refined with O—H = 0.84±0.01 Å and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{equiv}}(\text{O})$.

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
