## 2-Cyclopentylidenehydrazinecarboxamide

Hoong-Kun Fun, ${ }^{a}$ * $\ddagger$ Wan-Sin Loh, ${ }^{\text {a }} \S$ Mahesh Padaki, ${ }^{\text {b }}$ Arun M. Isloor ${ }^{\text {b }}$ and Nishitha A. Isloor ${ }^{\text {c }}$<br>${ }^{\text {a }}$ X-ray Crystallography Unit, School of Physics, Universiti Sains Malaysia, 11800 USM, Penang, Malaysia, ${ }^{\text {b }}$ Medicinal Chemistry Laboratory, Department of Chemistry, National Institute of Technology Karnataka, Surathkal, Mangalore 575 025, India, and ${ }^{\text {c }}$ Biotechnology Division, Department of Chemical Engineering, National Institute of Technology Karnataka, Surathkal, Mangalore 575 025, India Correspondence e-mail: hkfun@usm.my

Received 25 July 2012; accepted 3 August 2012
Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$;
$R$ factor $=0.049 ; w R$ factor $=0.114 ;$ data-to-parameter ratio $=20.6$.

The asymmetric unit of the title compound, $\mathrm{C}_{6} \mathrm{H}_{11} \mathrm{~N}_{3} \mathrm{O}$, consists of two independent molecules in which the cyclopentane rings adopt envelope conformations with $\mathrm{CH}_{2}$ grouping as the flap and the semicarbazone groups are essentially planar, with maximums deviation of 0.0311 (12) and 0.0285 (12) $\AA$. In the crystal, $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}, \mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the molecules to form sheets lying parallel to the $a b$ plane.

Hoong-Kun Fun, Wan-Sin Loh, Mahesh Padaki, Arun M. Isloor and Nishitha A. Isloor

## S1. Comment

Various semicarbazones, have been known to possess biological activities against many of the most common species of bacteria (Dogan et al., 1999). Semicarbazones are of much interest due to their wide spectrum of antibacterial activities (Pandeya \& Dimmock, 1993). Recently some workers reviewed the bioactivity of semicarbazones and they have exhibited anticonvulsant (Pandeya et al., 1998; Yogeeswari et al., 2004) and antitubercular (Sriram et al., 2004) properties. Our previous report highlights the synthesis and crystal structures of the semicarbozones (Fun et al., 2011). In continuation of our studies in this area, we now report the synthesis and structure of the title compound.
The asymmetric unit of the title compound, Fig. 1, consists of two crystallographically independent molecules. The cyclopentane (C1-C5) rings adopt an envelope conformation. The semicarbazone groups (O1/N1-N3/C6) are essentially planar with maximum deviation of 0.0311 (12) $\AA$ at atom N2A and 0.0285 (12) $\AA$ at atom N2B. Bond lengths and angles are comparable with the related structures (Fun et al. 2009a,b).
In the crystal, Fig. 2, N2A-H1N2 $\cdots \mathrm{O} 1 \mathrm{~B}, \mathrm{~N} 3 \mathrm{~A}-\mathrm{H} 1 \mathrm{~N} 3 \cdots \mathrm{~N} 1 \mathrm{~B}, \mathrm{~N} 3 \mathrm{~A}-\mathrm{H} 2 \mathrm{~N} 3 \cdots \mathrm{O} 1 \mathrm{~A}, \mathrm{~N} 2 \mathrm{~B}-\mathrm{H} 2 \mathrm{~N} 2 \cdots \mathrm{O} 1 \mathrm{~A}, \mathrm{~N} 3 \mathrm{~B}-$ H3N3 $\cdots$ O1B, N3B—H4N3 $\cdots$ N1A and C1A—H1AB $\cdots$ O1B hydrogen bonds (Table 1), link the molecules to form planes parallel to the $a b$ plane.

## S2. Experimental

Semicarbazide hydrochloride $(0.66 \mathrm{~g}, 0.0059 \mathrm{~mol})$ and freshly recrystallized sodium acetate $(0.58 \mathrm{~g}, 0.007 \mathrm{~mol})$ were dissolved in water ( 10 ml ) following a literature procedure (Furniss et al., 1978). The reaction mixture was stirred at room temperature for 10 minutes. To this, cyclopentanone ( $0.5 \mathrm{~g}, 0.0059 \mathrm{~mol}$ ) was added and shaken well. A little alcohol was added to dissolve the turbidity. It was shaken for 10 more minutes and allowed to stand. The semicarbazone crystallized on standing for 6 h . The separated crystals were filtered, washed with cold water and recrystallized from ethanol as colourless plates. M.p. 495-498 K.

## S3. Refinement

N - bound H atoms were located from the difference Fourier map and were refined freely $[\mathrm{N}-\mathrm{H}=0.858$ (18) to 0.926 (19) $\AA]$. The remaining H atoms were located geometrically and were refined using a riding model with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$ $[\mathrm{C}-\mathrm{H}=0.99 \AA]$. In the final refinement, one outliner was omitted, 6118.

Figure 1
The molecular structure of the title compound, showing $50 \%$ probability displacement ellipsoids.

## Figure 2

The crystal packing of the title compound, viewed along the $a$ axis. H atoms not involved in the intermolecular interactions (dashed lines) have been omitted for clarity.

> $l=-18 \rightarrow 21$

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.0422 P)^{2}+0.6439 P\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\max }<0.001$
$\Delta \rho_{\text {max }}=0.28 \mathrm{e} \AA^{-3}$
$\Delta \rho_{\text {min }}=-0.30$ e $\AA^{-3}$

## Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier \& Glazer, 1986) operating at 100.0 (1) K.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
