Received 14 September 2012; accepted 26 September 2012

Key indicators: single-crystal X-ray study; $T = 193\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; disorder in main residue; R factor = 0.047; wR factor = 0.093; data-to-parameter ratio = 13.7.

In the title compound, $[\text{Ru}_3(\text{C}_{25}\text{H}_{23}\text{N})(\text{C}_5\text{H}_5)_3]\cdot 3\text{PF}_6\cdot 2\text{C}_3\text{H}_6\text{O}$, the cation is a triruthenium complex of a 9,10-dihydroanthracene derivative. Three RuCp^+ (Cp is cyclopentadienyl) groups are bonded to the three aromatic rings of the ligand. Surprisingly, the pyramidalized N atom of the heterocycle ($\Sigma \text{C}-\text{N}-\text{C} = 329.0^\circ$) points towards the anthracenyl group, so losing its coordinative ability. There is an intermolecular $\text{C}-\text{H}\cdots\pi$ interaction involving an acetone molecule and the adjacent benzyl ring of the ligand. In the crystal, molecules are linked via a number of $\text{C}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{F}$ interactions and a $\text{C}-\text{H}\cdots\pi$ interaction, leading to the formation of a three-dimensional supramolecular structure. One of the Cp groups is disordered over two positions, with refined occupancies of 0.695 (14):0.305 (14). Two of the three hexafluorophosphate anions are disordered, with refined occupancies of 0.630 (6):0.370 (6) and 0.771 (8):0.229 (8). One of the two solvent acetone molecules is also disordered, with refined occupancies of 0.82 (2):0.18 (2).

Tris(η^5 -cyclopentadienyl)-tris[η^6 -[9,10-dihydroanthracene-9,10-endo-3',4'-(N-benzyl)pyrrolidine]]triruthenium(II) tris(hexafluorophosphate) acetone disolvate

Ielyzaveta Bratko, Sonia Mallet-Ladeira, Nathalie Saffon, Emmanuelle Teuma and Montserrat Gómez

S1. Comment

In the last years, we have been interested in the design of new ligands for studying original ways to coordinate transition metals with the purpose of finding applications in homogeneous catalysis. Within this framework, we have explored the synthesis of original 9,10-dihydroanthracene backbones fused with pyrrolidine groups (Sanhes *et al.*, 2008). They offer the possibility of coordinating to metal atoms through both the heterocyclic moiety (Sanhes *et al.*, 2008, 2009, 2010) and the aromatic rings, leading to polynuclear systems potentially interesting for studying cooperative effects in catalysis. In contrast to the large number of works published concerning the π -coordination chemistry of anthracene and also 9,10-dihydroanthracene derivatives, no studies have been reported in relation to the π -interactions of Diels–Alder adducts involving anthracene with transition metals.

Our aim is to study the coordination chemistry of the new ligand 9,10-dihydroanthracene-9,10-endo-3',4'-(N-benzyl)-pyrrolidine (Bratko *et al.*, 2012), through π -interactions with metal fragments. Ruthenium(II) organometallic precursors containing the RuCp⁺ moiety were chosen because of its known ability to give metal–arene complexes. Herein, we describe the crystal structure of, to the best of your knowledge, the first tris-ruthenium(II) complex of this kind of ligands.

The molecular structure of the title trinuclear ruthenium(II) cation is shown in Fig. 1. The asymmetric unit contains a tris(η^5 -cyclopentadienyl)-[(tris- η^6)-(9,10-dihydroanthracene-9,10-endo-3',4'-(N-benzyl)-pyrrolidine)]-triruthenium(II) cation, three hexafluorophosphate anions and two molecules of acetone. In the cation, the N atom of the heterocycle is pyramidalized (Σ C—N—C = 328.95°), and points towards the anthracenyl group. This is in contrast to the situation in the free ligand (Bratko *et al.*, 2012), where the N atom is involved in a C—H···N interaction with the chloroform solvent molecule. In both compounds the pyrrolidine ring has an envelope conformation with the N atom as the flap. A weak intramolecular interaction between one H of the benzyl group (C21-H) and one of the aromatic rings of the backbone is observed (Fig. 1), favoured by the electron-deficient aromatic group of the 9,10-dihydroanthracenyl moiety upon ruthenium coordination. The deviation of atom N1 from the four planar atoms of the heterocycle in the ligand is 0.631 (1) Å, compared to 0.562 (3) Å in the title cation. There is a C—H··· π interaction involving an acetone molecule and the adjacent benzyl ring of the ligand (Table 1).

In the crystal, molecules are linked via a second C—H··· π interaction, leading to the formation of an inversion dimer (Table 1 and Fig. 2). There are also a number of C—H···O and C—H···F interactions present, resulting finally in the formation of a three-dimensional supramolecular structure (Table 1).

S2. Experimental

The trinuclear complex was prepared by adding $[\text{RuCp}(\text{CH}_3\text{CN})_3]\text{PF}_6$ (38.6 mg, 0.09 mmol) to a degassed solution of the ligand 9,10-dihydroanthracene-9,10-*endo*-3',4'-(*N*-benzyl)-pyrrolidine (10 mg, 0.03 mmol) in 8 ml of 1,2-dichloroethane. The resultant solution was then refluxed overnight. The reaction mixture was cooled and the solvent evaporated under vacuum. Single crystals were obtained from an acetone solution of the isolated complex at room temperature. The complex was characterized by high-resolution mass spectrometry (ES+, methanol): calc. mass for $[\text{C}_{40}\text{H}_{38}\text{NRu}_3.2\text{PF}_6]^+$ 1126.9451; found: 1126.9471. Further spectroscopic data for the title compound are available in the archived CIF.

S3. Refinement

One of the cyclopentadienyl groups ($\text{C}36\text{--C}40/\text{C}36'\text{--C}40'$) is disordered over two positions with refined occupancies of 0.695 (14):0.305 (14). Two of the three hexafluorophosphate anions (involving atoms P1 and P3) are disordered with refined occupancies of 0.630 (6):0.370 (6) and 0.771 (8):0.229 (8), respectively. One of the two molecules of solvent is also disordered with refined occupancies of 0.82 (2):0.18 (2). The SAME, DELU and SIMU restraints were applied for all of the disordered atoms (Sheldrick, 2008). All the H atoms were included in calculated positions and treated as riding: C—H = 0.95 Å (CH-aromatic), 0.98 Å (CH₃), 0.99 Å (CH₂) and 1.0 Å (CH-methine), with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methyl H atoms and = 1.2 $U_{\text{eq}}(\text{C})$ for other H atoms.

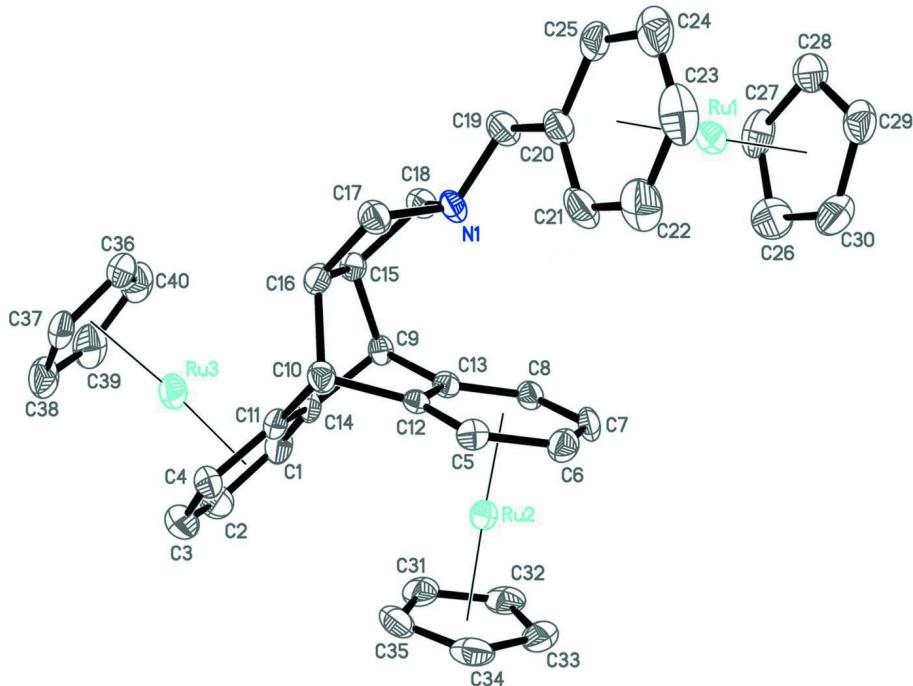

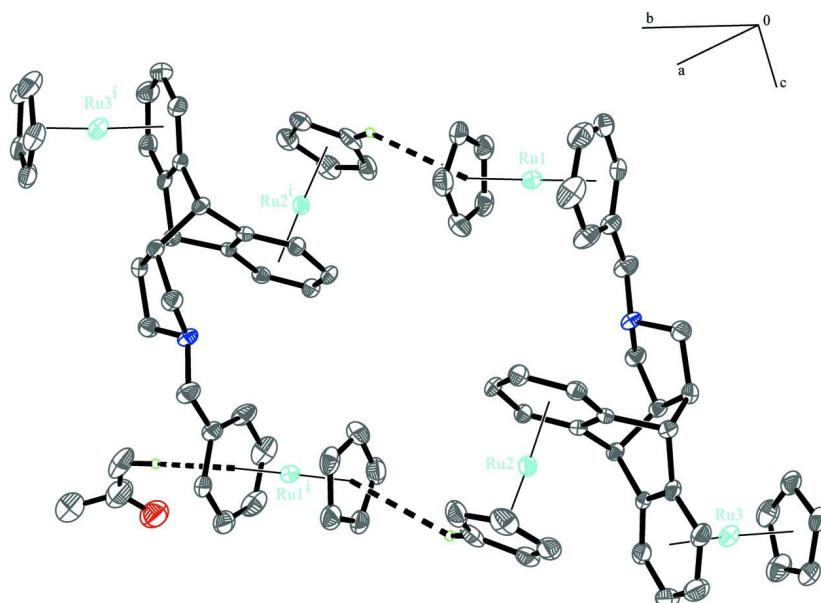

Figure 1

A view of the molecular structure of the title complex, with the atom numbering. Displacement ellipsoids are drawn at the 50% probability level. The three PF_6^- anions, the acetone solvent molecules, the minor fragments of the disordered atoms and the H atoms have been omitted for clarity.

**Figure 2**

View showing the formation of the inversion dimer resulting from intermolecular C—H \cdots π interactions, shown as dashed lines. [Symmetry code: (i) -x, 1 - y, 1 - z].

Special details

Experimental. Spectroscopic data for the title compound: ^1H NMR (300 MHz in $(\text{CD}_3)_2\text{CO}$): 6.68–6.70 (m, 2H, Harom); 6.56–6.58 (m, 2H, Harom); 6.35–6.37 (m, 2H, Harom); 6.30–6.31 (m, 3H, Harom of Bn); 6.23–6.26 (m, 2H, Harom); 6.00–6.03 (m, 2H, Harom); 5.67 (m, 5H, Cp); 5.43 (s, 5H, Cp); 4.91 (s, 5H, Cp); 4.31 (m, 2H, $\text{H}_{9,10}$); 3.16 (s, 2H, H_{19}); 3.08–3.10 (m, 2H, H_{17} or H_{18}); 2.78–2.84 (m, 2H, H_{15+16}); 2.49–2.54 (m, 2H, H_{17} or H_{18}). ^{13}C NMR (75 MHz in $(\text{CD}_3)_2\text{CO}$): 115.3, 107.0 ($\text{C}_{11,12,13,14}$); 87.5 (CHarom); 87.3 (CH of Bn); 87.1, 85.9, 84.9, 84.7 (CH arom); 83.2 (Cp); 82.5(Cp); 82.3 (Cp); 58.7 (C_{19}); 58.5 ($\text{C}_{17,18}$); 48.2 ($\text{C}_{15,16}$); 44.3($\text{C}_{9,10}$).

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg1 is the centroid of the C20—C25 ring and Cg2 is the centroid of the C26—C30 ring.
