Received 17 October 2012; accepted 19 October 2012

 Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  $R$  factor = 0.030;  $wR$  factor = 0.077; data-to-parameter ratio = 15.7.

The asymmetric unit of the racemic title compound,  $\text{C}_{10}\text{H}_{16}\text{N}_2\text{S}_2$ , a  $C_2$ -symmetric bis(thiolactam), contains one half-molecule, the complete molecule being generated by a twofold axis symmetry operation. The five-membered ring is nearly planar, with a maximum deviation of 0.025 (1) Å. In the crystal, the molecules are linked *via* weak  $\text{C}-\text{H}\cdots\text{S}$  interactions, forming infinite chains along the  $b$ -axis direction.

**(±)-(rel-3*R*,3'*R*)-1,1'-Dimethyl-3,3'-bipyrrolidine-2,2'-dithione**

Lee G. Madeley, Andreas Lemmerer and Joseph P. Michael

**S1. Comment**

The title compound, (±)-(rel-3*R*,3'*R*)-1,1'-dimethyl-3,3'-bipyrrolidine-2,2'-dithione, was obtained as a minor product from the attempted S<sub>RN</sub>1 arylation of deprotonated 1-methylpyrrolidine-2-thione with 4-bromoanisole under photolytic conditions. Previous workers had reported the same dimer from the reaction of deprotonated 1-methylpyrrolidine-2-thione with molecular iodine – apparently incorrectly as the *meso* diastereomer (Tamaru *et al.*, 1978), later corrected to the C<sub>2</sub>-symmetric isomer (Schroth *et al.*, 2000).

The asymmetric unit of the title compound consists of half a molecule around a twofold axis, and Fig. 1 shows the atomic numbering scheme. The complete molecule is generated by the twofold axis. Both stereogenic centres have the same relative configuration, which is depicted in Fig. 1 as *rel*-(*R,R'*). The opposite enantiomer in the crystal is generated by the *c*-glide in *C2/c*. The hydrogen bonding of the title compound consists of weak C—H⋯S hydrogen bonds from the methyl group to generate hydrogen bonded chains along the *b*-axis by unit cell translations only (Fig. 2).

**S2. Experimental**

A solution of 1-methylpyrrolidine-2-thione (580 mg, 5.5 mmol) in dry tetrahydrofuran (20 ml) was treated at 0 °C with a solution of *n*-butyllithium in hexane (5.5 mol). After 20 min 4-bromoanisole (690 μl, 5.5 mmol) was added, and the solution was irradiated for 30 min with a mercury lamp (125 W). The reaction mixture was poured into aq. NH<sub>4</sub>Cl solution, and the organic components were extracted with dichloromethane. Chromatography of the residue on silica gel after evaporation of the solvent returned unreacted 4-bromoanisole (50%), thiolactam (38%) and (±)-(rel-3*R*,3'*R*)-1,1'-dimethyl-3,3'-bipyrrolidine-2,2'-dithione (104 mg, 18%). The product was recrystallized from acetone to give colourless cubes, m.p. 476–477 K.

**S3. Refinement**

The C-bound H atoms were geometrically placed (C—H bond lengths of 0.99 for methylene CH<sub>2</sub> and 0.98 for methyl CH<sub>3</sub>) and refined as riding with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  or  $1.5U_{\text{eq}}(\text{C})$ .

**Figure 1**

The asymmetric unit of (I) showing the atomic numbering scheme. Displacement ellipsoids are shown at the 50% probability level. Atoms with superscript (i) are at the symmetry position  $(-x, y, -z + 1/2)$ .

**Figure 2**

View of the hydrogen bonded chains of (I). C—H...S are shown as dashed red lines.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
