Received 18 March 2013; accepted 9 April 2013

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.042; wR factor = 0.132; data-to-parameter ratio = 17.8.

The title compound, $\text{C}_{17}\text{H}_{11}\text{ClN}_2\text{O}_2$, which contains two stereogenic C atoms, crystallizes in a centrosymmetric space group as a racemate. The pyran ring and the isoxazole ring adopt sofa and twisted conformations, respectively. The dihedral angle between the benzene ring and the mean plane through the near coplanar atoms of the pyran ring is $4.17(5)^\circ$. The molecular conformation features a weak $\text{C}-\text{H}\cdots\text{O}$ contact. In the crystal, $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds link the molecules, forming chains along the *a*-axis direction.

***rac*-3-(4-Chlorophenyl)-3a,4-dihydro-3H-chromeno[4,3-c]isoxazole-3a-carbonitrile**

S. Paramasivam, J. Srinivasan, P.R. Seshadri and M. Bakthadoss

S1. Comment

As a continuation of our research related to isoxazole containing chromenoisoxazole moiety, we analysed the crystal structure of *rac*-6-Ethoxy-3,3a,4,9 b-tetrahydro-1,3- diphenyl-1*H*-chromeno[4,3-*c*]isoxazole- 3a-carbonitrile (Paramasivam *et al.*, 2012). The present compound exhibits the pronounced similarity to the previous ones, either in bond lengths and angles as well as in molecular conformations.

Isoxazole derivative exhibit anti-fungal (Mullen *et al.*, 1988) and anti-consulant (Eddington *et al.*, 2002) activities whereas benzopyran and chromenopyrrole derivatives exhibit anti-HIV activities (Kashiwada *et al.*, 2001) and used in the treatment of impulsive-disorder disease (Caine, 1993). On these grounds, the title compound was chosen for X-ray structure analysis (Fig. 1).

The pyran ring (O2/C1/C6—C9) adopts a sofa conformation with the puckering parameters (Cremer & Pople, 1975) being $q_2=0.359$ (1) Å, $q_3=-0.292$ (1) Å, $Q_1=0.463$ (1) Å and the five-membered isoxazole ring (N1/O1/C7/C8/C11) adopts an envelope conformation with puckering parameters (Cremer & Pople, 1975) being $q_2=0.284$ (1) Å and $\Phi_2=142.4$ (3)°.

The dihedral angle between the pyran and the benzene rings (C1—C6) is 4.17 (5)°. The dihedral angle between the chromeno ring (fusion of benzene and pyran rings) and isoxazole ring is 13.42 (5)°. In the chromenoisoxazole moiety, the dihedral angle between the benzene and isoxazole ring is 10.83 (5)° and the dihedral angle between the pyran and isoxazole ring is 14.81 (5)°.

The geometric parameters of the title compound (Fig. 1) agree well with the reported ones of similar structures (Paramasivam *et al.*, 2012).

The molecular structure is stabilized by C—H···O intramolecular interaction and the crystal packing is stabilized by C—H···O hydrogen bonds (Table 1).

S2. Experimental

A solution of (*E*)-3-(4-chlorophenyl)-2-((2-((*E*)-(hydroxyimino)methyl)phenoxy)methyl) acrylonitrile (2 mmol) in CCl_4 at (273–283 K) was added pinch wise NCS (4 mmol) over 3 h. After Et_3N (4 mmol) was added the reaction mixture was stirred at room temperature for 2 h. After completion of the reaction, reaction mixture was evaporated under reduced pressure and the resulting crude mass was diluted with water (15 mL) and extracted with ethyl acetate (3×15 mL). The combining organic layer was washed with brine (2×10 mL) and dried over anhydrous Na_2SO_4 . The organic layer was evaporated and purified by column chromatography (silica gel 60–120 mesh 7% EtOAc in hexanes) to provide the desired pure product 3-(4-chlorophenyl)-3a,4-dihydro-3*H*-chromeno[4,3-*c*]isoxazole-3a-carbonitrile a as colourless solid.

S3. Refinement

Hydrogen atoms were positioned geometrically and allowed to ride on their parent atoms, with C—H = 0.93 - 0.97 Å and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methyl H atoms and 1.2 $U_{\text{eq}}(\text{C})$ for other H atoms.

$$w = 1/[\sigma^2(F_o^2) + (0.0796P)^2 + 0.2931P]$$

where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$

$$\Delta\rho_{\max} = 0.24 \text{ e } \text{\AA}^{-3}$$

$$\Delta\rho_{\min} = -0.37 \text{ e } \text{\AA}^{-3}$$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
