Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.043; wR factor = 0.123; data-to-parameter ratio = 10.6.

In the title compound, $C_{15}H_{15}NO_2$, the dihedral angle between the aromatic rings is 5.86 (6)°, and an intramolecular N—H···O hydrogen bond generates an S(6) motif, which helps to stabilize the enamine–keto tautomer. An intramolecular O—H···O hydrogen bond also occurs. In the crystal, inversion dimers linked by pairs of O—H···O hydrogen bonds generate $R_2^2(10)$ loops. A C—H···O interaction links the dimers into [010] chains and aromatic π–π stacking [centroid–centroid separation = 3.6131 (9) Å] also occurs.

6-[(2,4-Dimethylanilino)methylidene]-2-hydroxycyclohexa-2,4-dienone

Shaukat Shujah, Saqib Ali, Zia-ur-Rehman, M. Nawaz Tahir and Auke Meetsma

S1. Comment

As part of our ongoing studies of Schiff bases (Shuja *et al.* 2007), here we report the synthesis and structure of title compound, (I), (Fig. 1). In the molecular structure of (I) the bond distances C7–O2 [1.298 (13) Å] and C1–N1 [1.311 (14) Å] indicate keto-amino tautomeric form. This is further confirmed by a formation of strong intramolecular hydrogen bond N–H···O [N···O = 2.587 (12) Å] resulting in an S(6) ring. The C8–N1–C1–C2 torsion angle is 179.91 (12). The C1–N1 bond length [1.311 (14) Å] is smaller than the N1–C8 bond length [1.417 (14) Å]. The C1–C2 bond length [1.416 (16) Å] indicate a double-bond character and the short C5–C6 bond distance [1.372 (16) Å] of benzene core suggests the presence of quinoid effect (Blagus *et al.*, 2011). The molecules are connected by π–π interactions and O–H···O hydrogen bonds forming a two dimensional network (Fig. 2)

S2. Experimental

An ethanolic solution (50 ml) of 2,4-dimethylaniline (2.5 mmol, 0.30 g) was added dropwise with constant stirring to a hot ethanolic solution (50 ml) of 2,3-dihydroxybenzaldehyde (2.5 mmol, 0.34 g) in a round bottomed flask equipped with a water condenser. The reaction mixture was kept under reflux for 2 h, cooled and kept at room temperature for 48 h. Red blocks of (I) were obtained on slow evaporation of the solvent.

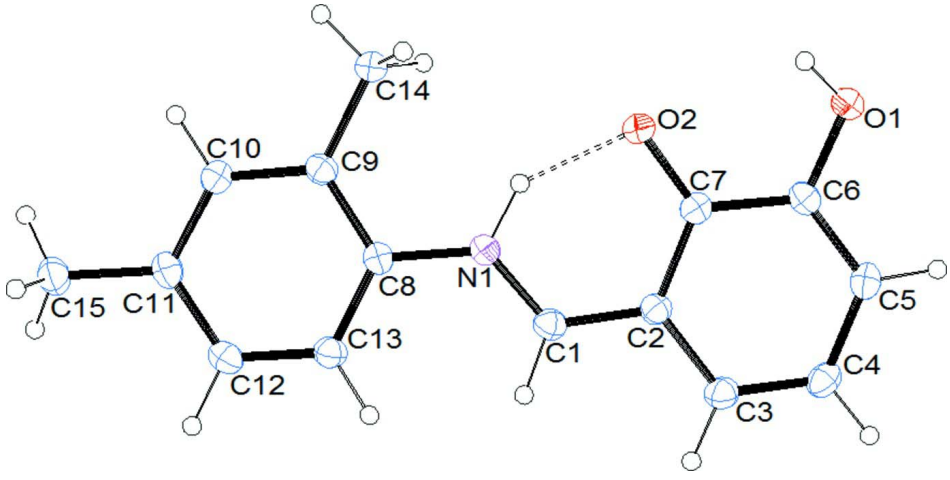

Figure 1

The molecular stucture of (I), with displacement ellipsoids drawn at the 50% probability level. The intramolecular N—H···O hydrogen bond is shown as dashed lines.

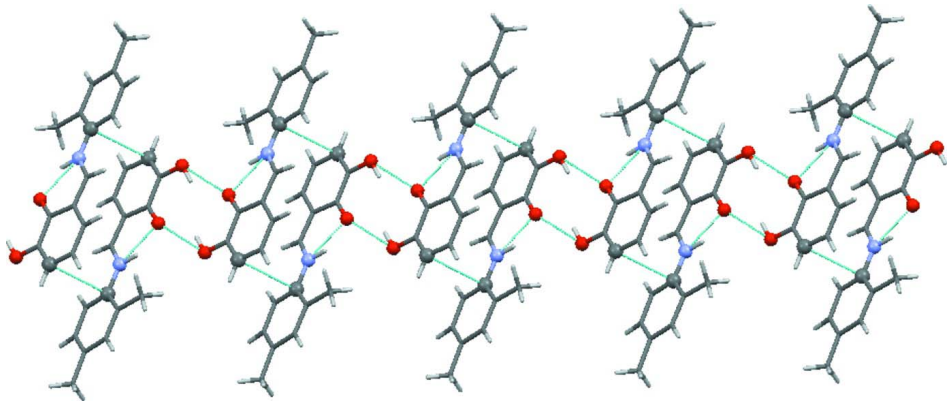

Figure 2

Schiff base molecules connected by π–π interactions and O—H···O hydrogen bonds.

$l = -13 \rightarrow 13$

Refinement

Refinement on F^2
Least-squares matrix: full
$R[F^2 > 2\sigma(F^2)] = 0.043$
$wR(F^2) = 0.123$
$S = 1.09$
2363 reflections
223 parameters
0 restraints

Primary atom site location: structure-invariant direct methods
Secondary atom site location: structure-invariant direct methods
Hydrogen site location: inferred from neighbouring sites
All H-atom parameters refined

$w = 1/[\sigma^2(F_o^2) + (0.0825P)^2 + 0.0862P]$
where $P = (F_o^2 + 2F_c^2)/3$
$(\Delta/\sigma)_{max} < 0.001$

$\Delta\rho_{max} = 0.29$ e Å^{-3}
$\Delta\rho_{min} = -0.27$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
