Received 21 May 2013; accepted 30 May 2013

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.007$ Å; R factor = 0.033; wR factor = 0.074; data-to-parameter ratio = 11.7.

In the title compound, $\{[\text{NiTb}_2(\text{C}_{14}\text{H}_8\text{N}_2\text{O}_5)_4(\text{H}_2\text{O})_4] \cdot 4\text{H}_2\text{O}\}_n$, the Tb^{III} ion is coordinated by one water molecule and seven O atoms from four 5-(pyridine-4-carboxamido)isophthalate (L) ligands in a distorted square-antiprismatic arrangement, while the Ni^{II} ion, lying on an inversion center, is six-coordinated in an octahedral geometry by two pyridine N atoms, two carboxylate O atoms and two water molecules. One L ligand bridges two Tb^{III} ions and one Ni^{II} ion through two carboxylate groups and one pyridine N atom. The other L ligand bridges two Tb^{III} ions and one Ni^{II} ion through two carboxylate groups, while the uncoordinating pyridine N atom is hydrogen bonded to an adjacent coordinating water molecule. Extensive $\text{O}-\text{H}\cdots\text{O}$, $\text{N}-\text{H}\cdots\text{O}$ and $\text{O}-\text{H}\cdots\text{N}$ hydrogen bonds play an important role in stabilizing the crystal structure.

Poly[[tetraquatetrakis[μ_3 -5-(pyridine-4-carboxamido)-isophthalato]nickel(II)diterbium(III)] tetrahydrate]

Yi-Fang Deng, Man-Sheng Chen, Chun-Hua Zhang and Xue Nie

S1. Comment

The synthesis and investigation of d-f heterometallic complexes are challenge for chemists and have attracted increasing attention in last few years since the competitive reaction containing d-f metal ions in conjunction with ligands often result in the formation of a mixture of homometallic assemblies rather than heterometallic analogous (Gu & Xue, 2006; Liang *et al.*, 2000; Prasad *et al.*, 2007; Zhao *et al.*, 2003, 2004;). We have recently prepared the title compound, a new transition metal(II)–lanthanide(III) coordination polymer, under hydrothermal conditions.

In the title compound, the Tb^{III} ion is eight-coordinated by seven O atoms from four 5-(pyridine-4-carboxamido)-isophthalate (*L*) ligands and one water molecule, forming a distorted square-antiprismatic geometry (Fig. 1). It is interesting that the carboxylate groups of two unique *L* ligands exhibit different coordination modes: one coordinates to two Tb^{III} ions and one Ni^{II} ion using its two carboxylate groups with μ_1 - η^1 : η^1 -chelate and μ_2 - η^1 : η^1 -bis-monodentate coordination modes while the pyridyl group is free of coordination, the other one coordinates to two Tb^{III} ions through the carboxylate groups with μ_1 - η^1 : η^1 -chelate coordination mode and to one Ni^{II} ion through the pyridyl group. Based on the coordination modes of the carboxylate and pyridyl groups, a complicated three-dimensional network is formed (Fig. 2), which is similar to the complexes {[LnCo_{0.5}(INAIP)₂(H₂O)₂].2H₂O}_n (Chen *et al.*, 2011; Deng *et al.*, 2011).

S2. Experimental

A mixture of Tb(NO₃)₃.6H₂O (22.1 mg, 0.05 mmol), H₂L (28.7 mg, 0.1 mmol), NiSO₄.6H₂O (13.1 mg, 0.05 mmol), NaOH (6.0 mg, 0.15 mmol), EtOH (4 ml) and H₂O (6 ml) was heated in a 16 ml capacity Teflon-lined reaction vessel at 453 K for 3 days. The reaction mixture was cooled to room temperature over a period of 48 h. The product was collected by filtration, washed with H₂O and air-dried.

S3. Refinement

H atoms bonded to C and N atoms were placed geometrically and refined as riding atoms, with C—H = 0.93 and N—H = 0.86 Å and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$. The water H atoms were found from difference Fourier maps and refined with a restraint of O—H = 0.85 (1) Å. In final refinements, these H atoms were refined as riding atoms with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{O})$. H2WA was refined isotropically.

Figure 1

The asymmetric unit of the title compound. Displacement ellipsoids are drawn at the 30% probability level. [Symmetry codes: (A) $x, y, -1+z$; (B) $2-x, 1-y, 2-z$; (C) $2-x, 1-y, 1-z$; (D) $x, -1+y, z$; (E) $-1+x, y, z$.]

Figure 2

A view showing the three-dimensional network of the title compound.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
