Received 3 June 2014; accepted 6 June 2014

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.063; wR factor = 0.134; data-to-parameter ratio = 22.9.

In the title pyrimidine-2,4-dione derivative, $\text{C}_{14}\text{H}_{16}\text{N}_2\text{O}_2\text{S}$, the dihedral angle between the six-membered rings is 77.81 (10)°. The molecule is twisted about the C_p-S (p = pyrimidine) bond, with a $\text{C}-\text{S}-\text{C}-\text{N}$ torsion angle of -59.01 (17)°. An intramolecular $\text{C}-\text{H}\cdots\text{S}$ hydrogen bond generates an $S(5)$ ring motif. In the crystal, bifurcated acceptor $\text{N}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds generate inversion-related dimers incorporating $R_2^1(9)$ and $R_2^2(8)$ loops. These dimers are connected into a chain extending along the a -axis direction by a second pair of inversion-related $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds, forming another $R_2^2(8)$ loop. The crystal structure is further stabilized by weak intermolecular $\text{C}-\text{H}\cdots\pi$ interactions, generating a three-dimensional network.

6-[(2-Methylphenyl)sulfanyl]-5-propylpyrimidine-2,4(1*H*,3*H*)-dione

Nadia G. Haress, Hazem A. Ghabbour, Ali A. El-Emam, C. S. Chidan Kumar and Hoong-Kun Fun

S1. Comment

Pyrimidine-2,4-diones and their related derivatives have long been known for their diverse chemotherapeutic activities (Al-Abdullah *et al.*, 2014, Al-Deeb *et al.*, 2013) including antiviral activity against HIV (Tanaka *et al.*, 1995; Hopkins *et al.*, 1996; El-Emam *et al.*, 2004), and HSV viruses (Russ *et al.*, 2003). In addition, potent anticancer activity was observed for several pyrimidine-2,4-diones (Nencka *et al.*, 2006). In a continuation of our interest in the chemical and pharmacological properties of pyrimidine and uracil derivatives (Al-Abdullah *et al.*, 2011; El-Brollosy *et al.*, 2009), we have synthesized the title compound (I) as a potential chemotherapeutic agent.

In the title compound (Fig. 1), the two six-membered rings (C1–C6 and C8–C11/N1/N2) are essentially planar, with maximum deviations of -0.012 (2) Å at atom C5 and 0.020 (2) Å at atom C10, respectively. The molecule is bent at the S atom with C6–S1–C8–N1 torsion angle of -59.01 (17)°. The heterocycle containing the structural unit CON₂H₂CO forms a dihedral of 77.81 (10)° with the adjacent benzene ring. Bond lengths and angles in (I) show normal values (Allen *et al.*, 1987) and are comparable with those in related structures (Al-Omary *et al.*, 2014; El-Brollosy *et al.*, 2011; Wang *et al.*, 2006). An intramolecular C—H···S hydrogen bond generates an *S*(5) ring motif. In the crystal structure, bifurcated acceptor N1–H1N1···O1 and C7–H7B···O1 (Table 1) hydrogen bonds link the two adjacent molecules into centrosymmetric inversion related dimers incorporating *R*₂¹(9) and *R*₂²(8) loops (Fig. 2, Bernstein *et al.*, 1995). These dimers are connected into a chain extending along *a*-axis direction via a pair of N2–H1N2···O2 hydrogen bonds (Table 1) resulting in another *R*₂²(8) loop (Fig. 2, Bernstein *et al.*, 1995). The crystal structure stability is further consolidated by weak intermolecular C–H··· π interactions (Table 1) involving the centroids of the six-membered C8–C11/N1/N2 (Cg1) and C1–C6 benzene (Cg2) rings.

S2. Experimental

A mixture of 6-chloro-5-propyluracil (943 mg, 0.005 mol), *o*-thiocresol (621 mg, 0.005 mol) and potassium hydroxide (281 mg, 0.005 mol), in ethanol (10 ml), was heated under reflux for 3 h. The solvent was then distilled off in vacuo and the residue was washed with cold water, dried and crystallized from ethanol to yield 940 mg (68%) of the title compound (C₁₄H₁₆N₂O₂S) as colorless needle crystals. M.P.: 210–212 °C.

¹H NMR (DMSO-*d*₆, 500.13 MHz): δ 0.84 (t, 3H, CH₂CH₃, *J* = 7.0 Hz), 1.37–1.40 (m, 2H, CH₂CH₃), 2.33 (s, 3H, Ar—CH₃), 2.43 (t, 2H, CH₂CH₂CH₃, *J* = 7.0 Hz), 6.92–7.02 (m, 3H, Ar—H), 7.26–7.28 (m, 1H, Ar—H), 10.91 (s, 1H, NH), 11.24 (s, 1H, NH). ¹³C NMR (DMSO-*d*₆, 125.76 MHz): δ 13.72 (CH₂CH₃), 22.06 (CH₂CH₃), 20.12 (Ar—CH₃), 28.22 (CH₂CH₂CH₃), 117.44 (Pyrimidine C-5), 125.90, 126.50, 129.88, 130.20, 133.18, 140.56 (Ar—C), 143.02 (Pyrimidine C-6), 150.53 (C=O), 163.23 (C=O).

S3. Refinement

The nitrogen-bound H-atoms were located in a difference Fourier map and were refined freely. Other H atoms were positioned geometrically (C=H 0.93–0.97 Å) and refined using a riding model with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ or $1.5 U_{\text{eq}}(\text{C})$ for methyl H atoms. A rotating group model was used for the methyl group.

Figure 1

The molecular structure of the title compound with atom labels and 30% probability displacement ellipsoids.

Figure 2

Crystal packing of the title compound, showing the hydrogen bonding interactions as dashed lines. H-atoms not involved in the hydrogen bonding are omitted for clarity.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.063$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.134$	$w = 1/[\sigma^2(F_o^2) + (0.0398P)^2 + 1.8642P]$
$S = 1.08$	where $P = (F_o^2 + 2F_c^2)/3$
4165 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
182 parameters	$\Delta\rho_{\text{max}} = 0.56 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.37 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (\AA , $^\circ$)

Cg1 and Cg2 are the centroids of C1–C6 and C8–C11/N1/N2 rings, respectively.

<i>D</i> —H \cdots <i>A</i>	<i>D</i> —H	H \cdots <i>A</i>	<i>D</i> \cdots <i>A</i>	<i>D</i> —H \cdots <i>A</i>
