In the title compound, $C_{15}H_{12}N_2S$, the methylthioquinazoline group is planar with the methyl C displaced by only 0.116 (3) Å from the plane of the quinazoline moiety. The dihedral angle between the phenyl ring and the quinazoline ring system is 13.95 (5)°. In the crystal, each molecule is linked by π–π stacking between to two adjacent inversion-related molecules. On one side, the inverted quinazoline groups interact with a centroid–centroid distance of 3.7105 (9) Å. On the other side, the quinazoline group interacts with the pyrimidine and phenyl rings of the second neighbour with centroid–centroid distances of 3.5287 (8) and 3.8601 (9) Å, respectively.

Crystal structure of 4-methylsulfanyl-2-phenylquinazoline

S1. Structural commentary

In the 4-(methylthio)-2-phenylquinazoline molecule (Fig 1), the angle between the planes through the phenyl and phenyl-quinazoline ring systems is 13.95 (5)°. The molecules are stacked in the [010] direction with approximately parallel molecular planes. With no strong H-bond donors, one N atom accepts a long C—H···N contact linking molecules along [101]. The second N atom is not involved. 4-Methylthioquinazoline derivatives can be obtained from reaction of the potassium salt of 3*H*-quinazoline-4-thiones with iodomethane (Leonard & Curtin, 1946; Meerwein *et al.*, 1956). Quinazoline-4-thiones are produced from the corresponding 3*H*-quinazoline-4-ones using phosphorus pentasulfide (Hearn, *et al.*, 1951), Lawesson's reagent (Segarra *et al.*, 1998) or isothiocyanates (Blatter & Lukaszewski, 1964). In a continuation of our research focused on new synthetic routes towards novel substituted 4-alkylthioquinazoline derivatives (Smith *et al.*, 2005*a,b*) we have synthesized 4-(methylthio)-2-phenylquinazoline in a high yield (Smith *et al.*, 2005*a*).

S2. Synthesis and crystallization

To a solution of 2-phenyl-3*H*-quinazoline-4-thione (4.81 g, 20.2 mmol) in a 1:1 mixture of MeOH and water (50 ml) containing KOH (3.0 g), was added iodomethane (3.41 g, 24.0 mmol). The reaction mixture was stirred for 20 min at room temperature and the solid obtained was filtered, washed with H_2O (3 × 30 ml), dried and recrystallized from Et_2O to give 4-(methylthio)-2-phenylquinazoline (4.63 g, 18.3 mmol, 91%) as colourless crystals, m.p. 93-94 °C [lit. 94 °C (H_2O); Meerwein *et al.*, 1956). ^{1}H NMR (400 MHz, CDCl$_3$, δ, p.p.m.) 8.70-8.66 (m, 2 H, ArH), 8.10-8.03 (m, 2 H, ArH), 7.83 (app. dt, J = 1, 8 Hz, 1 H, H-7), 7.58-7.51 (m, 4 H, ArH), 2.85 (s, 3 H, CH$_3$). ^{13}C NMR (100 MHz, CDCl$_3$, d, p.p.m.) 171.8 (s, C-2), 159.2 (s, C-4), 149.1 (s, C-8a), 138.5 (s, C-1 of Ph), 133.9 (d, C-7), 131.0 (d, C-4 of Ph), 129.4 (d, C-8), 129.0 (d, C-3/C-5 of Ph), 128.9 (d, C-2/C-6 of Ph), 127.1 (d, C-6), 124.1 (d, C-5), 123.0 (s, C-4a), 13.0 (q, CH$_3$). EI—MS (*m/z*, %): 252 (*M*$^+$, 100), 251 (72), 205 (60), 102 (47), 77 (61), 51 (33). CI—MS (*m/z*, %): 253 (*MH*$^+$, 100), 207 (3). HRMS (CI): Calculated for C$_{15}$H$_{13}$N$_2$S [*MH*] 253.0794; found, 253.0789.

S3. Refinement

H atoms were placed in calculated positions with C—H = 0.95 and 0.98 Å and refined in riding mode, U$_{iso}$(H) = 1.5U$_{eq}$(C) for methyl H atoms and 1.2U$_{eq}$(C) for aromatic H atoms.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
