Received 13 July 2014; accepted 17 July 2014

Edited by D.-J. Xu, Zhejiang University (Yuquan Campus), China

In the title compound, C₁₀H₁₀N₂S, all non-H atoms are almost coplanar [maximum deviation = 0.103 (1) Å]. In the crystal, N—H···S interactions form R₂²(8) rings linking pairs of molecules related by inversion. The molecular pairs are stacked along [100]. A herringbone arrangement of pairs in the [010] direction forms layers parallel to (010).

Keywords: crystal structure; N—H···S interactions; quinazoline-4(3H)-thione; hydrogen-bonded dimers; herringbone arrangement.

Crystal structure of 2-ethylquinazoline-4(3*H*)-thione

Mohammed B. Alshammari, Keith Smith, Amany S. Hegazy, Benson M. Kariuki and Gamal A. El-Hiti

S1. Structural commentary

The 2-ethyl-3*H*-quinazoline-4-thione molecule (Fig 1) is almost planer (apart from the ethyl hydrogens) with the ethyl group being twisted from the quinazoline-4-thione plane by 8.7 (2)°. N—H⋯S interactions form R₂²(8) rings to link pairs of molecules related by inversion. The pairs of molecules are stacked parallel to the *a*-axis (Fig 2). Adjacent pairs pack in a herring bone arrangement in the [010] direction to form layers parallel to the (010) plane. 2-(Substituted alkyl)-3*H*-quinazoline-4-thione derivatives can be obtained from double lithiation of 2-alkyl-3*H*-quinazoline-4-thiones followed by reactions with electrophiles, including alkyl iodides, at low temperature in anhydrous THF (El-Hiti, 2004). Also, 3*H*-quinazoline-4-thiones are produced from the corresponding 3*H*-quinazoline-4-ones using phosphorus pentasulfide (Bogert *et al.*, 1903; Ozturk *et al.*, 2007; El-Hiti *et al.*, 2011) or Lawesson's reagent (Segarra *et al.*, 1998). 3*H*-Quinazoline-4-thiones have also been synthesized in one-step from reaction of 2-aminobenzonitriles and thioamides in the presence of hydrogen bromide in various solvents on a steam bath for 1–4 h (Zoltewicz & Sharpless, 1976).

S2. Synthesis and crystallization

2-Ethyl-3*H*-quinazoline-4-thione was obtained in 92% yield from double lithiation of 2-methyl-3*H*-quinazoline-4-thione with *n*-butyllithium at 78 °C in anhydrous THF under nitrogen followed by reaction with iodomethane (El-Hiti, 2004). Crystallization from methanol gave the title compound as yellow crystals. The NMR and low and high resolution mass spectra for the title compound were consistent with those reported (El-Hiti, 2004).

S3. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 1. H atoms were placed in calculated positions with C—H = 0.95 and 0.98 Å and refined in riding mode, $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methyl H atoms and $1.2U_{\text{eq}}(\text{C})$ for aromatic H atoms

 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.30 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.25 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
