Received 11 March 2015; accepted 7 April 2015

Edited by W. T. A. Harrison, University of Aberdeen, Scotland

The title compound, pentabarium tetraindium hexantimony, was synthesized by an indium-flux reaction and its structure features layers composed of edge-sharing In₂Sb₆ units. The voids between the In₄Sb₆ layers are filled by Ba²⁺ cations, which are all surrounded by six Sb atoms and form bicapped octahedral or triangular prismatic coordination geometries. There are five barium ions in the asymmetric unit: one has no imposed crystallographic symmetry, two lie on mirror planes and two have *mm*2 point symmetry. The two In atoms and four Sb atoms in the asymmetric unit all lie on general crystallographic positions.

Keywords: crystal structure; barium; indium; antimony; In—In interconnections.

Crystal structure of $\text{Ba}_5\text{In}_4\text{Sb}_6$

Ming-Yan Pan, Sheng-Qing Xia and Xu-Tang Tao

S1. Comment

Single crystal of $\text{Ba}_5\text{In}_4\text{Sb}_6$ was obtained from a high-temperature In-flux reaction and it crystallizes in its own structure type. The layers are constituted by edge-shared In_2Sb_6 units and stack along the crystallographic *b*-axis direction. Each In is four-coordinated which is connected by three Sb and the other In atom. All Ba cations are six-coordinated with the bicapped octahedron or triangular prism geometries formed by Sb anions. The bond lengths of In1—In1 and In2—In2 are 2.9655 (11) and 2.8544 (11) Å, respectively, comparable to In—In interconnections in EuIn_2As_2 (2.765 Å) (Goforth *et al.*, 2008) and CaIn_2 (2.92 Å) (Iandelli, 1964).

S2. Experimental

The title compound was synthesized through the high temperature In flux reaction. All starting elements were handled inside an Argon-filled glove box with controlled oxygen and moisture levels below 0.1 p.p.m.. The reaction conditions were optimized as follows: Ba, In and Sb in a molar ratio of 3:30:5 were loaded in an alumina crucible, which were subsequently flame-sealed in a fused silica tube. The reactants were heated quickly to 1173 K and allowed to dwell at this temperature for 20 h. After a slow cooling process down to 773 K at a rate of 2 K/h, the molten In was removed by centrifugation.

S3. Refinement

The residual electron densities show a maximum peak of 1.997 e/Å³ and a minimum hole of -1.689 e/Å³, which are 0.78 and 1.58 Å to Ba3 and In1, respectively.

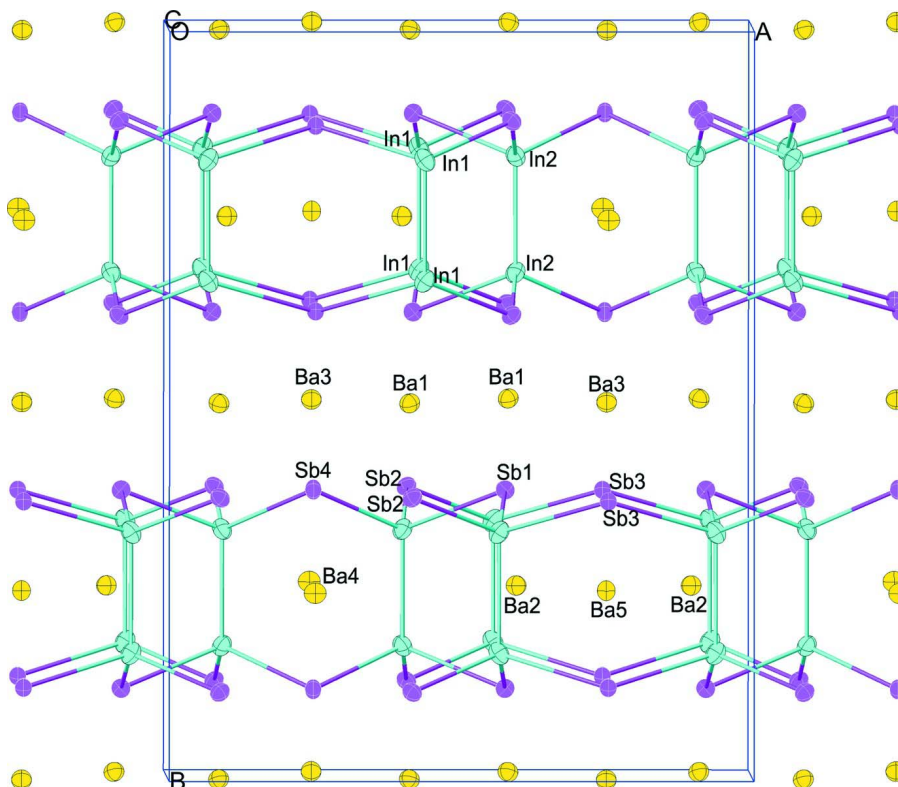

Figure 1

The ellipsoid of $\text{Ba}_5\text{In}_4\text{Sb}_6$, viewed along the c -axis. The barium cations, Indium atoms and antimony anions were plotted as yellow, light blue and purple spheres, respectively. Ellipsoids are drawn at the 80% probability level.

 2008), $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
 Extinction coefficient: 0.000211 (8)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
