Received 1 August 2015; accepted 9 August 2015

Edited by W. T. A. Harrison, University of Aberdeen, Scotland

In the title compound, C<sub>20</sub>H<sub>17</sub>ClN<sub>2</sub>O<sub>2</sub>S, the dihedral angle between the planes of the benzothiazole fused ring system (r.m.s. deviation = 0.024 Å) and the chlorobenzene ring is 89.62 (12)°. The ester C–O–C side chain has an *anti* orientation [torsion angle = –155.2 (3)°]. In the crystal, weak aromatic  $\pi$ – $\pi$  stacking interactions are observed between the phenyl and pyrimidine rings [centroid–centroid separation = 3.666 (2) Å].

**Keywords:** crystal structure; pyrimido[2,1-b][1,3]benzothiazole; ester; biological activity.

**CCDC reference:** 1406433

## Crystal structure of ethyl 4-(2-chlorophenyl)-2-methyl-4*H*-pyrimido[2,1-*b*][1,3]benzothiazole-3-carboxylate

Balbir Kumar, Manmeet Kour, Satya Paul, Rajni Kant and Vivek K. Gupta

### S1. Experimental

To a mixture of ethylacetoacetate (1.0 mmol, 0.13 g), 2-chlorobenzaldehyde (1.0 mmol, 0.14 g) and 2-aminobenzothiazole (1.0 mmol, 0.152 g) in a round bottom flask (25 ml),  $C/TiO_2 \cdot SO_3 \cdot SbCl_2$  (0.1 g) was added and the reaction mixture was heated at 363 K under solvent-free conditions for 1 h. Hot ethanol ( $2 \times 5$  ml) was added to the reaction mixture and the catalyst was separated by simple filtration. Removal of the solvent under reduced pressure afforded the product, which was further crystallized from ethanol as yellow crystals (Yield: 88%).

### S2. Refinement

All the H atoms were geometrically fixed and allowed to ride on their parent C atoms, with C—H distances of 0.93–0.96 Å; and with  $U_{iso}(H) = 1.2U_{eq}(C)$ , except for the methyl group where  $U_{iso}(H) = 1.5U_{eq}(C)$ .

where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} < 0.001$   
 $\Delta\rho_{\max} = 0.64 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.35 \text{ e } \text{\AA}^{-3}$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
