The title compound,  $[\text{Cu}(\text{C}_{24}\text{H}_{20}\text{NP}_2\text{S}_2)(\text{C}_{18}\text{H}_{15}\text{P})_2]\cdot\text{CH}_2\text{Cl}_2$  or  $[\text{Cu}(\text{dppaS}_2^-)(\text{PPh}_3)_2]\cdot\text{CH}_2\text{Cl}_2$ , is a neutral mononuclear copper(I) complex bearing an *N,N*-bis(diphenylphosphorothioyl)amide ( $\text{dppaS}_2^-$ ) ligand and two triphenylphosphane ligands. The molecular structure shows that the two S atoms of the  $\text{dppaS}_2^-$  ligand [ $\text{Cu}-\text{S} = 2.3462(9)$  and  $2.3484(9)$  Å] and the two P atoms of the two triphenylphosphane ligands [ $\text{Cu}-\text{P} = 2.3167(9)$  and  $2.2969(9)$  Å] coordinate to the copper(I) atom, resulting in a tetrahedral coordination geometry. The crystallographically observed molecular structure is compared to the results of DFT calculations.

## 1. Chemical context

Copper(I) complexes have been studied actively because of the abundance of the metal ore and their interesting luminescent properties (Costa *et al.*, 2012). The most well-explored copper(I) complexes are those bearing nitrogen and phosphorus donor atoms, which display strong emission and long-lived lifetime of the excited states (Czerwieniec *et al.*, 2013). On the other hand,  $\text{Cu}^{\text{I}}$  complexes bearing sulfur donor ligands have not been well studied in this respect. Several years ago, we reported some emissive copper(I) complexes bearing diphosphane disulfide (Dairiki *et al.*, 2009). In addition, an interesting reaction was also reported in which a sulfur atom of the diphosphane disulfide ligand was transferred to another diphosphane ligand (Tsukuda *et al.*, 2012). We describe here the crystal structure of a neutral copper(I) complex  $[\text{Cu}(\text{dppaS}_2^-)(\text{PPh}_3)_2]$  bearing the anionic diphosphane disulfide ligand *N,N*-bis(diphenylphosphorothioyl)amide ( $\text{dppaS}_2^-$ ) and two triphenylphosphane ligands.

## 2. Structural commentary

The molecular structure of  $[\text{Cu}(\text{dppaS}_2)(\text{PPh}_3)_2]$  shows that the two sulfur atoms of the dppaS<sub>2</sub><sup>−</sup> ligand and the two phosphorus atoms of the two triphenylphosphane ligands coordinate to the copper atom, resulting in a tetrahedral coordination geometry (Fig. 1). The bond lengths between the copper(I) atom and the two sulfur atoms of the dppaS<sub>2</sub><sup>−</sup> ligand are Cu—S = 2.3462 (9) and 2.3484 (9)  $\text{\AA}$ , and those between the copper atom and the phosphorus atoms of the triphenylphosphane ligands are Cu—P = 2.3167 (9) and 2.2969 (9)  $\text{\AA}$ . The diphosphine disulfide ligand forms a six-membered ring adopting a boat conformation. The bond order of the P6—S2 and P7—S3 bonds are considered to be slightly smaller than two because the lengths of the bonds are considerably longer than general P=S (= 1.91  $\text{\AA}$ ) bond lengths (Wilson *et al.*, 1999) by *ca* 0.1  $\text{\AA}$  (Table 1). P6—N8 and P7—N8 appear to have double-bond character because at 1.587 (2) and 1.584 (2)  $\text{\AA}$ , respectively, they are significantly shorter than the typical N—P (= 1.66  $\text{\AA}$ ) bond length.

**Figure 1**

The structure of the molecular components of  $[\text{Cu}(\text{dppaS}_2)(\text{PPh}_3)_2]\cdot\text{CH}_2\text{Cl}_2$ , showing 50% probability displacement ellipsoids. H atoms have been omitted for clarity.

**Table 2**  
Bond lengths and angles ( $\text{\AA}$ ,  $^\circ$ ) for the optimized and obtained structure of  $[\text{Cu}(\text{dppaS}_2)(\text{PPh}_3)_2]$ .

Parameter	calculated (singlet)	crystal
Cu—S	2.422, 2.428	2.3462 (9), 2.3484 (9)
Cu—P	2.336, 2.329	2.2969 (9), 2.3167 (9)
S—P	2.042, 2.042	1.9920 (11), 2.0047 (11)
P—N	1.608, 1.607	1.587 (2), 1.584 (2)
S—Cu—S	111.75	114.96 (3)
P—Cu—P	122.81	121.28 (3)
Dihedral angle	87.74	86.69

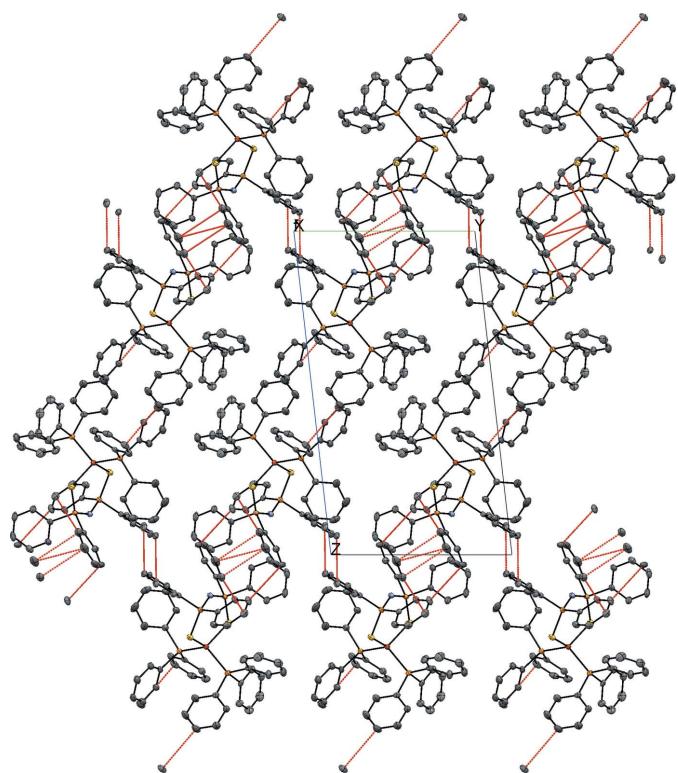

The dihedral angle is between the S2/Cu1/S3 and P4/Cu1/P5 planes.

## 3. Supramolecular features

The space group of the crystal is  $P\bar{1}$ , and the asymmetric unit consists of a complex molecule, so that a unit cell contains two complex molecules. In the crystal, weak C—H $\cdots$ C interactions are observed (Fig. 2 and Table 1).

## 4. DFT calculations

Calculations were performed with the *GAUSSIAN09* software (Frisch *et al.*, 2009) using the B3LYP method (Becke *et al.*, 1992, 1993; Lee *et al.*, 1988). The basis sets were as follows: copper, 6-311G with Wachters (1970) 4p functions; phosphorus, oxygen, and nitrogen, 6-31+G\*; carbon, 6-31G\*; and hydrogen, 6-31G. DFT calculations were performed and the

Computer programs: *CrystalClear* (Rigaku, 2000), *SIR92* (Altomare *et al.*, 1993), *SHELXL97* (Sheldrick, 2008), *Mercury* (Macrae *et al.*, 2006) and *CrystalStructure* (Rigaku, 2015).

results compared with experimental values (Table 2). The optimized structure in the singlet ground state is roughly consistent with crystal structure. The calculated Cu—S and Cu—P bond lengths are in agreement with the experimental value within 0.08 Å. The S—Cu—S and P—Cu—P bond angles, and the dihedral angle between the S/Cu/S and P/Cu/P planes obtained by DFT calculations and experimentally are in good agreement. The near right angle (87°) of the dihedral angle shows that the tetrahedral geometry seems to be favorable for the complex.

## 5. Synthesis and crystallization

Under an argon atmosphere, 5 ml anhydrous dichloromethane were added with stirring to a mixture of *N,N*-bis(diphenylphosphorothioyl)amine (HdppaS<sub>2</sub>) (135 mg, 0.3 mmol) and potassium *tert*-butoxide (35 mg, 0.3 mmol). Triphenylphosphane (157.4 mg, 0.6 mmol) and [Cu(CH<sub>3</sub>CN)<sub>4</sub>]PF<sub>6</sub> (111.8 mg, 0.3 mmol) were then added to the reaction solution. After the solution had been stirred for one h at room temperature, a white powder (KPF<sub>6</sub>) precipitated. The mixture was then filtered. The solution was added to ethanol (20 ml) and the resulting colorless crystals were obtained by

filtration. Yield 256 mg (82%). Analysis found: C, 69.43; H, 4.85; N, 1.36%. Calculated for [Cu(dppaS<sub>2</sub>)(PPh<sub>3</sub>)<sub>2</sub>]<sub>·</sub>CH<sub>2</sub>Cl<sub>2</sub>: C, 69.51; H, 4.86; N, 1.35%. <sup>31</sup>P{<sup>1</sup>H} NMR (202 MHz, CDCl<sub>3</sub>) 34.6 (*t*, *J* = 53.16 Hz, dppaS<sub>2</sub>), −2.5 (*s, br*, triphenylphosphane). Broadening of the <sup>31</sup>P signals of the phosphorus atoms directly coordinating to the copper atom, which has a large quadrupole moment, has frequently been observed (von Rekowski *et al.*, 2014). Single crystals suitable for X-ray diffraction were obtained during the synthetic procedure.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. The non-hydrogen atoms were refined anisotropically. All H atoms were positioned geometrically and refined isotropically using the riding model with C—H = 0.99 Å and *U*<sub>iso</sub>(H) = 1.2*U*<sub>eq</sub>(C) for methylene groups, and 0.95 Å and *U*<sub>iso</sub>(H) = 1.2*U*<sub>eq</sub>(C) for aromatic groups.

$$(\Delta/\sigma)_{\max} = 0.001$$

$$\Delta\rho_{\max} = 1.10 \text{ e \AA}^{-3}$$

$$\Delta\rho_{\min} = -0.46 \text{ e \AA}^{-3}$$

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement was performed using all reflections. The weighted R-factor ( $wR$ ) and goodness of fit ( $S$ ) are based on  $F^2$ . R-factor (gt) are based on F. The threshold expression of  $F^2 > 2.0$  sigma( $F^2$ ) is used only for calculating R-factor (gt).
