In the title compound, $C_{19}H_{15}Cl_6NO_4$ [+solvent], the six-membered ring of the norbornene moiety adopts a boat conformation and the two five-membered rings have envelope conformations. The pyrrolidine ring makes a dihedral angle of 14.83 (12)° with the 3,4-dimethoxyphenyl ring, which are attached to each other by an extended N—CH₂—CH₂—C_{ar} bridge. In the crystal, the structure features C—H \cdots O intermolecular hydrogen bonds, an offset π - π interaction [intercentroid distance = 3.564 (1) Å] and a C—Cl \cdots π interaction. The contribution of some disordered solvent to the scattering was removed using the SQUEEZE routine [Spek (2015). Acta Cryst. C71, 9–18] of PLATON. The solvent contribution was not included in the reported molecular weight and density.

1. Chemical context

One of the fundamental objectives of organic and medicinal chemistry is the design and synthesis of molecules having value as human therapeutic agents (Patil & Rajput, 2014). Succinimide derivatives are significant compounds found in various natural products, and have outstanding biological and pharmaceutical activity (Ahire & Mhaske, 2017). Cyclic imides and their derivatives contain an imide ring and the general structure —CO—N(R)—CO—, and can cross biological membranes *in vivo* (Hargreaves *et al.*, 1970). The variety of biological activities and pharmaceutical uses of compounds containing a succinimide moiety is considerable. They include activities such as antifungal (Hazra *et al.*, 2004), anti-tubercular (Isaka *et al.*, 2006), CNS depressant (Aeberli *et al.*, 1976), antispasmodic (Nunes *et al.*, 1995), cytostatic (Crider *et al.*, 1980), analgesic (Correa *et al.*, 1997), antibacterial (Zentz *et al.*, 2002), anticancer (Hall *et al.*, 1995), anorectic (Rich & Gardner, 1983), hypotensive (Coram & Brezenoff, 1983), nerve conduction blocking (Kaczorowski *et al.*, 2008), bacteriostatic (Piper *et al.*, 1971), anti-convulsant (Kornet *et al.*, 1977) and muscle relaxant (Musso *et al.*, 2003).

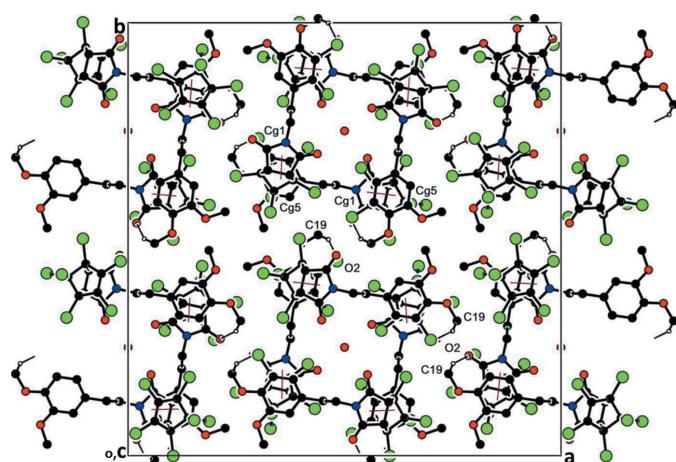

OPEN ACCESS

**Figure 1**

The molecular structure of the title compound, with the atom labelling. Displacement ellipsoids are drawn at 30% probability level.

2. Structural commentary

The molecular structure of the title compound is shown in Fig. 1. The six-membered ring of the norbornene moiety (C2/C3/C5/C7–C9) adopts a boat conformation [puckering parameters: amplitude $Q = 0.939 (2)$ Å, $\theta = 90.00 (12)$ °, $\varphi = 299.27 (14)$ °]. The two five-membered rings, A (C2/C3/C5–C7) and B (C5–C9), have envelope conformations with atom C6 as the flap: puckering parameters and the smallest displacement asymmetric parameters are $Q_2 = 0.619 (2)$ Å, $\varphi_2 = 108.6 (2)$ ° and $\Delta s = 1.09$ ° for ring A, and $Q_2 = 0.582 (2)$ Å, $\varphi_2 = 215.5 (2)$ ° and $\Delta s = 0.74$ ° for ring B. Atom C6 is displaced from the mean plane through the other four atoms by 0.908 (2) Å in ring A and 0.875 (2) Å in ring B. The dihedral angle between the pyrrolidine ring (N1/C1–C4) and the benzene ring (C12–C17) is 14.83 (12)°, with the torsion angle N1–C10–C11–C12 being 175.8 (3)°. The lengths of the C–Cl bonds involving the chlorine atoms attached to the C8=C9 double bond are 1.692 (2) Å for C8–Cl2 and 1.692 (2) Å for C9–Cl3. The lengths of the bonds to chlorine atoms attached to the single C–C bonds vary from 1.744 (2) to 1.768 (2) Å. These values

**Figure 2**

A view along the c axis of the crystal packing of the title compound. The C–H...O hydrogen bonds (thin black lines; Table 1) generate an $R^4_4(48)$ ring motif. The offset $\pi\cdots\pi$ interaction is shown as a thin red line. For clarity, H atoms not involved in hydrogen bonding have been omitted.

Table 1

Hydrogen-bond geometry (Å, °).

$Cg5$ is the centroid of the C12–C17 benzene ring.

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
$C19-H19A\cdots O2^i$	0.96	2.57	3.408 (4)	146
$C6-Cl6\cdots Cg5^{ii}$	1.77 (1)	3.41 (1)	4.894 (2)	140 (1)

Symmetry codes: (i) $y + \frac{1}{4}, -x + \frac{3}{4}, -z + \frac{7}{4}$; (ii) $-y + \frac{3}{4}, x - \frac{1}{4}, -z + \frac{3}{4}$.

are close to those found in similar compounds; see §4 Database survey.

3. Supramolecular features

In the crystal, weak $C19-H19A\cdots O2^i$ hydrogen bonds link the molecules to form a cyclic $R^4_4(48)$ ring motif (Table 1 and Fig. 2). The molecules are stacked in layers held together by offset $\pi\cdots\pi$ interactions (Fig. 2), with an intercentroid distance $Cg1\cdots Cg5^{iii}$ of 3.564 (1) Å [$Cg1$ and $Cg5$ are the centroids of the pyrrolidine (N1/C1–C4) and benzene (C12–C17) rings, respectively, $\alpha = 9.80 (12)$ °, interplanar distances are 3.448 (1) and 3.547 (1) Å, offset = 0.353 Å; symmetry code: (iii) $-y + \frac{3}{4}, x - \frac{1}{4}, -z + \frac{3}{4}$. There is also an intermolecular C–Cl $\cdots\pi$ interaction present, involving atom Cl6 and the centroid of the benzene ring (C12–C17); see Table 1.

4. Database survey

A search of the Cambridge Structural Database (CSD, V 5.40, update February 2019; Groom *et al.*, 2016) for the 4,5,6,7,8,8-hexachloro-3a,4,7,7a-tetrahydro-1*H*-4,7-methanoisoindole-1,3(2*H*)-dione skeleton yielded 17 hits (see supporting information). The majority of these compounds have thiophene substituents. One compound, 1,7,8,9,10,10-hexachloro-4-(2-phenylethyl)-4-azatricyclo[5.2.1.0^{2,6}]dec-8-ene-3,5-dione (CSD refcode EVEDIT; Manohar *et al.*, 2011), closely resembles the title compound but has a 2-phenethyl substituent rather than the 2-(3,4-dimethylphenethyl) group in the title compound. Here, the aryl ring is inclined to the pyrrolidine ring by 7.43 (16)° compared to 14.83 (12)° in the title compound, and the N–C–C–C_{ar} torsion angle is –169.3 (3)° compared to 175.8 (3)° in the title compound.

In all 17 structures, the five-membered ring has envelope conformations and the six-membered ring a boat conformation. The bond lengths and bond angles are very similar to those reported here for the title compound. For example, the Csp^2 –Cl bond lengths are shorter than the Csp^3 –Cl bond lengths; the former vary from *ca* 1.681 to 1.717 Å, while the latter vary from *ca* 1.725 to 1.798 Å. In the title compound these bond lengths are 1.691 (2)–1.692 (2) Å and 1.744 (2)–1.768 (2) Å, respectively.

5. Synthesis and crystallization

2-(3,4-Dimethoxyphenyl) ethanamine (1 equiv.) and 1,4,5,6,7,7-hexachloro-5-norbornene-2,3-dicarboxylic anhy-

Computer programs: *APEX2* and *SAINT* (Bruker, 2008), *SHELXS97* (Sheldrick, 2008), *ORTEP-3 for Windows* (Farrugia, 2012), *SHELXL2018* (Sheldrick, 2015) and *PLATON* (Spek, 2009).

dride (1 equiv.) were stirred at room temperature in dry ethyl acetate for 30 min. The ethyl acetate was removed under reduced pressure and the resulting residue was dissolved in toluene. To this reaction mixture was added acetyl chloride (5 equiv.) and refluxed for 1 h. The reaction mixture was brought to room temperature and washed with aqueous Na₂CO₃ and dried over anhydrous Na₂SO₄. It was then filtered and the filtrate was concentrated under reduced pressure followed by silica gel column purification to afford the title compound in 82% yield. Colourless block-shaped crystals were obtained by slow evaporation of a solution in ethanol.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The hydrogen atoms were placed in calculated positions and refined using a riding model: C—H = 0.93–0.98 Å with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C-methyl})$ and $1.2U_{\text{eq}}(\text{C})$ for other H atoms. The contribution of the disordered solvent

to the scattering was removed using the SQUEEZE routine of *PLATON* (Spek, 2015). The solvent contribution was not included in the reported molecular weight and density. Further details are given in the archived CIF.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
