In the title compound, $[\text{Ag}(\text{CF}_3\text{SO}_3)(\text{C}_{10}\text{H}_6\text{F}_2\text{N}_2)_2]$, the Ag^{I} centre adopts a highly distorted trigonal-planar coordination environment resulting from its coordination by one O atom of the trifluoromethanesulfonate anion and the pyridine N atoms of two crystallographically independent 2',6'-difluoro-2,3'-bipyridine ligands, which display very similar conformations to one another. Pairwise $\text{Ag}\cdots\text{O-SO}_3\text{CF}_3^-$ [$\text{Ag}\cdots\text{O} = 2.8314$ (14) Å] interactions and intermolecular C—H \cdots O interactions between inversion-related units lead to the formation of an eight-membered cyclic dimer in which the silver atoms are separated by 6.2152 (3) Å. In the crystal, the dimers are linked through C—H \cdots O hydrogen bonds, halogen $\cdots\pi$ and weak $\pi\cdots\pi$ stacking interactions, resulting in the formation of a three-dimensional supramolecular network. The title compound exhibits a strong and broad emission band from 400 nm to 550 nm in solution and its photoluminescence quantum efficiency is estimated to be *ca* 0.2, indicating that the title compound could have applications as an emitting material in organic light-emitting diodes (OLEDs).

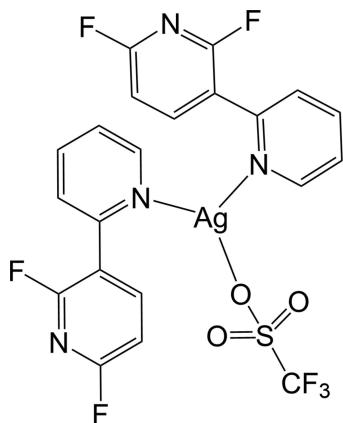

1. Chemical context

Recently, great attention has been paid to 2,3'-bipyridine-based Ir^{III} and Pt^{II} complexes by many researchers because of their applicability to OLEDs and solid-state lighting (Kang *et al.*, 2021; Reddy & Bejoymohandas, 2016). In particular, 2',6'-difluoro-2,3'-bipyridine complexes of iridium(III) are considered to be strong candidates as both blue triplet emitters in phosphorescent organic light-emitting diodes (PHOLEDs) and single dopants in white organic light-emitting diodes (WOLEDs) (Zaen *et al.*, 2019; Kang *et al.*, 2020; Lee *et al.*, 2018). Despite these investigations, reports regarding the structures and photoluminescence properties of 2,3'-bipyridine-based group-11 metal complexes are scarce, and related research is limited (Li *et al.*, 2019). Among the group-11 elements, coordination polymers of Ag^{I} have been demonstrated to exhibit structural diversity as a result of the d^{10} configuration of the metal ion (Lee *et al.*, 2020). Moreover, the various coordination environments around the Ag^{I} centre are generally constructed by the ligands, solvent molecules, and counter-anions (Lee *et al.*, 2016). Until now, there has been no report with respect to an Ag^{I} complex bearing a 2',6'-difluoro-2,3'-bipyridine ligand as compared to 2,2-bipyridine-based Ag^{I} complexes (Pal *et al.*, 2020). This fact prompted us to investigate the structures and luminescent properties of

OPEN ACCESS

2,3'-bipyridine-based Ag^I complexes: in this study, we report the preparation, structural characterization and luminescent properties of an Ag^I complex of 2',6'-difluoro-2,3'-bipyridine.

2. Structural commentary

The asymmetric unit in the title compound consists of an Ag^I cation, a CF₃SO₃⁻ trifluoromethanesulfonate anion and two crystallographically independent C₁₀H₆F₂N₂ 2',6'-difluoro-2,3'-bipyridine ligands, which adopt very similar conformations, such that the dihedral angles between the pyridyl rings in the N1- and N3-containing molecules are 53.11 (5) and

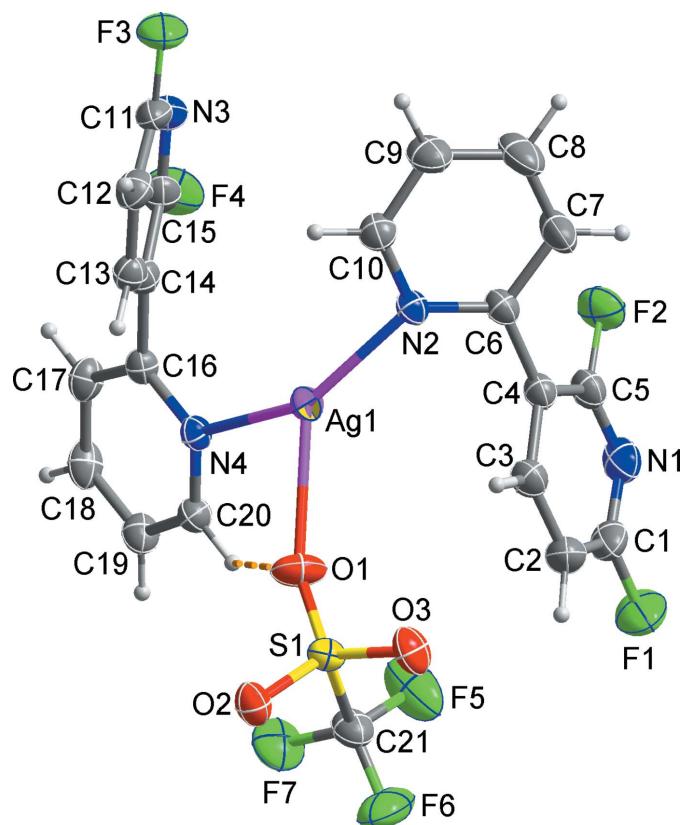

Figure 1

Figure 1
The molecular structure of the title compound, showing displacement ellipsoids at the 50% probability level. The orange dashed line represents an intramolecular C—H···O interaction.

Table 1
Selected geometric parameters (\AA , $^\circ$).

Ag1—N2	2.2305 (14)	Ag1—O1	2.4879 (13)
Ag1—N4	2.2496 (14)		
N2—Ag1—N4	148.65 (5)	N4—Ag1—O1	86.55 (5)
N2—Ag1—O1	124.02 (5)		

53.10 (7)°, respectively. As shown in Fig. 1, the Ag^I ion is coordinated by two pyridine N atoms (N2 and N4) from two 2',6'-difluoro-2,3'-bipyridine ligands and one O atom from the trifluoromethanesulfonate anion, forming a highly distorted trigonal-planar geometry. Selected bond lengths and angles around the Ag1 atom are given in Table 1: the N—Ag—N and N—Ag—O angles fall in the range 86.55 (5)–148.65 (5)°, deviating significantly from an ideal trigonal-planar geometry. This may reflect the influence of an additional Ag···O—SO₂CF₃[−] interaction between the metal ion and an O atom of an adjacent trifluoromethanesulfonate anion [Ag1···O2[−] = 2.8314 (14) Å; black dashed lines in Fig. 2; symmetry code: (i) $−x + 1, −y, −z + 1$]. The Ag^I atom is displaced out of the trigonal N2, N4, O1 coordination plane by 0.1057 (9) Å. The C6—C10/N2 and C16—C20/N4 pyridine rings coordinated to the Ag^I centre are tilted by 25.75 (10)° with respect to each other. The pairwise Ag···O links lead to the formation of an eight-membered [Ag—O—S—O—]₂ cyclic dimer, in which the silver atoms are separated by 6.2152 (3) Å. The cyclic dimer is consolidated by C—H···O interactions (Table 2; yellow dashed lines in Fig. 2).

3. Supramolecular features

In the extended structure, the dimers are linked through C19—H19 \cdots O3 hydrogen bonds (Table 2) and weak $\pi\cdots\pi$ stacking interactions [yellow and sky-blue dashed lines in

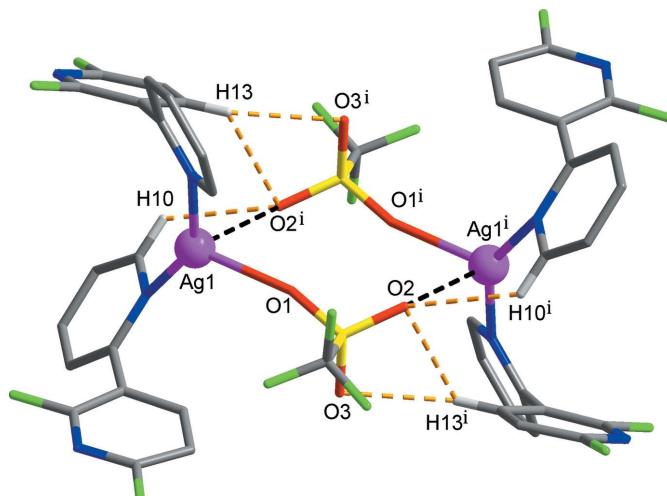

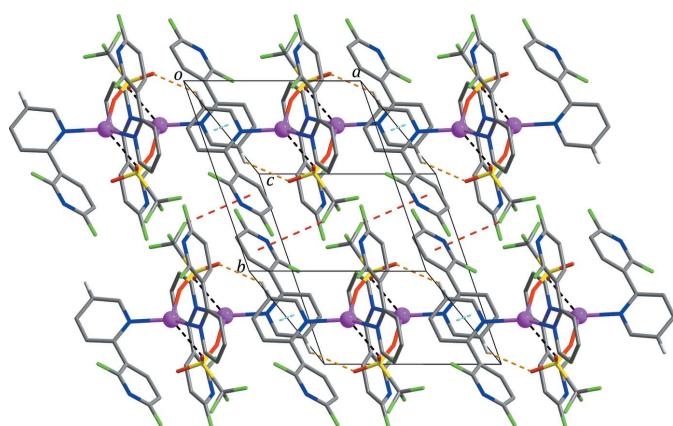

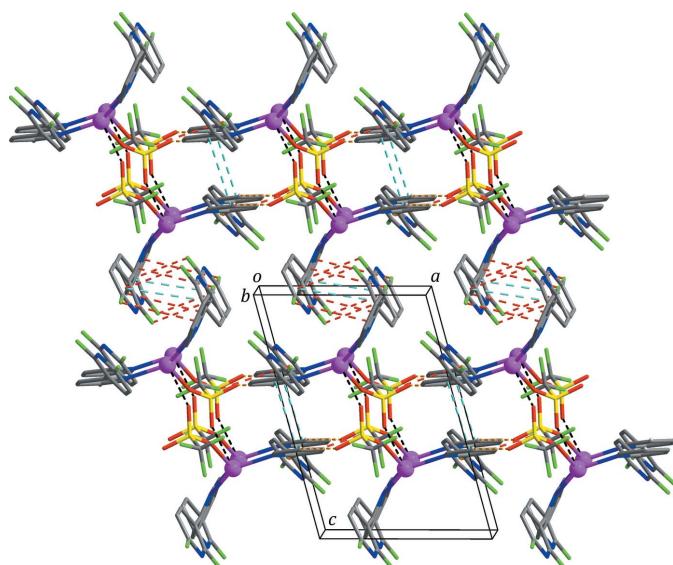

Figure 2

Figure 2
Dimeric structure formed by $\text{Ag}\cdots\text{O}$ (black dashed lines) and $\text{C}-\text{H}\cdots\text{O}$ (yellow dashed lines) interactions [symmetry code: (i) $-\text{x}+1, -\text{y}, -\text{z}+1$]. Atom colours: violet = silver, yellow = sulfur, green = fluorine, red = oxygen, blue = nitrogen, grey = carbon and white = hydrogen.

**Figure 3**

Symmetry codes: (i) $-x + 1, -y, -z + 1$; (ii) $x - 1, y, z$.

3.1424 (19) Å; $Cg1\cdots Cg1^{iv} = 4.2435(13)$ Å; $Cg1$ and $Cg2$ are the centroids of the C1—C5/N1 and C6—C10/N2 rings, respectively; symmetry code: (iv) $-x + 1, -y, -z$], resulting in the formation of a three-dimensional supramolecular network.

4. Luminescent properties

In CH_2Cl_2 solution, the title compound exhibits a strong and broad emission band with $\lambda_{\text{max}} = 400$ nm, as shown in Fig. 5. This emission band may arise from π — π^* transitions of the bipyridine ligand because the absorption of the title compound is very similar to that of the free ligand. Interestingly, upon the complexation of ligand with the $\text{Ag}(\text{CF}_3\text{SO}_3)$ unit, significant blue-shifted emissions (> 50 nm) are observed as compared with bipyridine based Ir^{III} complexes (Lee *et al.*, 2009). Moreover, a broad emission from 400 nm to 500 nm in the title compound may be due to the predominantly fluorescent emission from the 2',6'-difluoro-2,3'-bipyridine ligand because the emission maximum of the free ligand, *i.e.* phosphorescent emission, occurs at approximately 450 nm (triplet energy, $T_1 = 2.82$ eV). The observed emission of the title compound is therefore attributed to ligand-centered π — π^* transitions with a minor contribution of an Ag-based metal-to-ligand charge-transfer transition. Similar dual-emission behaviour has been noted for some Ag^I complexes with 2-methylthiazole (Rogovoy *et al.*, 2019)

**Figure 5**

Absorption and emission spectra of the free ligand and the title compound in solution [concentrations = 1.0×10^{-5} M] at room temperature (inset: emission photo); $\varepsilon \approx 100,000$ M⁻¹ cm⁻¹.

Computer programs: *APEX2* and *SAINT* (Bruker, 2014), *SHELXS97* and *SHELXTL* (Sheldrick, 2008), *SHELXL2014/7* (Sheldrick, 2015), *DIAMOND* (Brandenburg, 2010) and *pubLCIF* (Westrip, 2010).

and pyridylphosphine ligands (Baranov *et al.*, 2019). The emission intensity of the title compound was also higher than that of free ligand, as shown in Fig. 5. The photoluminescence quantum efficiency of the title compound was estimated to be *ca* 0.2 (Fig. 5, inset). Such an efficiency is large enough to potentially use the title compound as the emitting material in an organic light-emitting diode (OLED) application.

5. Database survey

A survey of *SciFinder* (SciFinder, 2021) for transition-metal complexes bearing the 2',6'-difluoro-2,3'-bipyridine moiety as a ligand gave 25 hits. They include reports about the crystal structures and photophysical properties of Ir^{III} and Pt^{II} complexes based on this ligand (HOVHAC, Lee *et al.*, 2009; OHUMUB01, Lee *et al.*, 2015; JUDZAL, Park *et al.*, 2015). The survey revealed no exact matches for the reported structure of the title complex. To the best of our knowledge, this is the first crystal structure reported for a silver complex with the title ligand.

6. Synthesis and crystallization

All experiments were performed under a dry N₂ atmosphere using standard Schlenk techniques. All solvents used in this study were freshly distilled over appropriate drying reagents prior to use. All starting materials were purchased commer-

cially and used without further purification. The ¹H NMR spectrum was recorded on a JEOL 400 MHz spectrometer. The ligand, 2',6'-difluoro-2,3'-bipyridine (Park *et al.*, 2015) was synthesized according to the previous report. The title compound was synthesized as follows: the ligand (0.075 g, 0.39 mmol) in THF (2 ml) was added to Ag(CF₃SO₃) (0.47 g, 1.0 mmol) in MeOH (2 ml) in the dark at room temperature and the mixture was stirred for 10 min. After that, the mixture was slowly evaporated in the air and a dark environment to obtain crystals suitable for X-ray crystallographic analysis. ¹H NMR (400 MHz, CD₃CN) δ 8.67 (*d*, *J* = 4.4 Hz, 1H), 8.62 (*td*, *J* = 8.8, 1.2 Hz, 1H), 7.88–7.80 (*m*, 2H), 7.37–7.34 (*m*, 1H), 7.08 (*dd*, *J* = 9.2, 3.6 Hz, 1H). ¹⁹F NMR (376 MHz, CD₃CN) δ -69.7, -71.8, 79.1. Analysis calculated for C₂₁H₁₂F₇N₄O₃SAg: C 39.33; H 1.89; N 8.74%; found: C 39.44, H 1.86, N 8.70%.

7. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. All H atoms were positioned geometrically and refined using a riding model: C—H = 0.95 Å with *U*_{iso}(H) = 1.2*U*_{eq}(C).

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
